TABLES

OF

LOGARITHMS

OF

ALL *NUMBERS*, FROM 1 TO 101000;

AND OF THE

SINES AND TANGENTS

TO EVERY

SECOND OF THE *QUADRANT.*

BY MICHAEL TAYLOR,

AUTHOR OF THE SEXAGESIMAL TABLE.

WITH A PREFACE AND PRECEPTS FOR THE EXPLANATION AND USE OF THE SAME,

BY NEVIL MASKELYNE, *F.R.S. ASTRONOMER ROYAL.*

UNIVERSITY OF ILLINOIS LIBRARY

LONDON:

PRINTED BY CHRISTOPHER BUCKTON, GREAT PULTENEY STREET;

AND

SOLD BY FRANCIS WINGRAVE, BOOKSELLER, SUCCESSOR TO MR. NOURSE IN THE STRAND.

M DCC XCII.

TO

THE RIGHT HONORABLE AND HONORABLE THE COMMISSIONERS OF LONGITUDE, IN WHOSE SERVICE THE DECEASED AUTHOR WAS EMPLOYED FOR FIFTEEN YEARS AS COMPUTER OF THE NAUTICAL ALMANAC AND IN OTHER SERVICES, BY WHOSE BOUNTY HE WAS ENABLED TO COMPLETE AND PRINT THESE LOGARITHMIC TABLES MORE EXTENSIVE AND ACCURATE THAN ANY EXTANT; AND TO WHOM HE, AS IN DUTY AND GRATITUDE BOUND, HAD HE LIVED, INTENDED TO HAVE DEDICATED THEM, THIS VALUABLE WORK IS MOST RESPECTFULLY INSCRIBED BY THEIR

MOST OBEDIENT AND DEVOTED,

HUMBLE SERVANT,

NEVIL MASKELYNE,

ASTRONOMER ROYAL.

820

LIST OF SUBSCRIBERS.

HIS MAJESTY KING GEORGE III.
HIS ROYAL HIGHNESS GEORGE, PRINCE OF WALES.
Her Royal Highneſs Madame ELISABETH of *France.*
His Moſt Serene Highneſs the REIGNING DUKE of *Saxe-Gotha.*
His Moſt Serene Highneſs the REIGNING DUKE of *Saxe-Weimar.*
His Moſt Serene Highneſs GODFREY, the REIGNING DUKE of *Bouillon.*
His Excellency Prince REZZONICO, Roman Senator, F. R. S.

PREFACE.

PREFACE.

LOGARITHMS are a ſet of artificial numbers, which have been calculated, and put in tables, to facilitate arithmetical calculations. They were invented by the learned and never-enough renowned *John Napier*, Baron of Merchiſton, in Scotland, and publiſhed by him in 1614. By their means the tedious operations of multiplication and diviſion of numbers, raiſing powers, and extracting roots, have been reduced to the addition and ſubtraction of their correſpondent logarithms, multiplying them by the index of the power, or dividing by the index of the root.

The improvements made by *Tycho Brahe*, the noble Dane, both in the theory and practice of aſtronomy, together with the determination of the true motions of the planets from his obſervations by his illuſtrious pupil *Kepler*, had greatly enlarged the bounds of this ſcience, and ſeemed to demand a more eaſy and expeditious method of calculating obſervations rendered capable of ſo much exactneſs, and leading to ſuch important diſcoveries. Baron *Napier* was probably acquainted with theſe improvements in ſcience before his invention of logarithms, and ſtimulated thereby in the purſuit of ſo uſeful a compendium of aſtronomical calculation. However that may be, he applied himſelf to the ſearch of this *deſideratum*, which he happily diſcovered, without any hint or communication from any one elſe, no leſs to his own honour, than the benefit of aſtronomy, and every branch of mathematics.

The table publiſhed by Baron *Napier*, conſiſted of natural and logarithmic ſines, co-ſines, and tangents, and was principally deſigned for the ſolution of ſpheric triangles, (in the doctrine of which, as well as of plane trigonometry, he was a conſummate maſter) but which he ſhewed might be occaſionally uſed to find the logarithms of numbers, though not with equal facility as the ſines and tangents. The logarithms, which he introduced, have been ſometimes called Naperian, from their author, but more generally hyperbolic, becauſe they were afterwards ſhewn to be meaſured by the areas of the hyperbola contained between the curve aſymtote and its ordinates; though ſince it has been ſhewn that every ſpecies of logarithms may be expreſſed by hyperbolic ſpaces. They have alſo ſometimes been called natural logarithms, becauſe they are what naturally ariſe in the ſolution of mathematical queſtions. Their ſcale is determined from hence, that the logarithm of a number which exceeds unity by an indefinitely ſmall quantity is equal to that quantity; whence the logarithm of 10 comes out 2.302585, &c.

This

This intereſting diſcovery was immediately taken up by the illuſtrious *Henry Briggs*, the firſt Profeſſor of Geometry at Greſham College, and afterwards Savilian Profeſſor of Aſtronomy at Oxford, who recommended the preſent ſcale of logarithms, as better adapted to the decimal ſcale of arithmetic; in which the logarithm of 1 being 0, as it ſhould be in every ſcale of logarithms, the log. of the ratio of 10 to 1 is 1, that of 100 to 1 is 2, that of 1000 to 1 is 3, and ſo on. This alteration was explained by Mr. *Briggs* in his public lectures at Oxford, and alſo communicated by him to Baron *Napier*, who entirely approved of it, ſaying at the ſame time, that he alſo had thought of it. Mr. *Briggs*, indeed, in imitation of Baron *Napier's* trigonometrical table, in which the logarithm of the ſine increaſes affirmatively as the ſine itſelf decreaſes from unity, had made the logarithm of numbers leſs than unity affirmative, and of thoſe greater than unity negative. Baron *Napier* ſaid he thought it more expedient, making 0, as before, the logarithm of unity, to make 100000 the logarithm of the radius, which was in fact only changing the ſigns of the logarithms propoſed by Mr. *Briggs*, with which alteration Mr. *Briggs* acquieſced, and accordingly ſet immediately about computing ample tables of logarithms to 14 places of figures, beſides the index, and in about 8 years, a ſhort time for ſo great a work, completed and publiſhed thoſe of 30 chiliads of numbers. He alſo computed a table of logarithmic ſines and tangents of arcs to every centeſm of a degree of the quadrant, likewiſe to 14 places of figures, beſides the index, which were printed under the care of *Adrian Vlacq*, at Gouda, in Holland; and the author in the mean time dying, publiſhed by *Henry Gellibrand*, Profeſſor of Aſtronomy at Greſham College, under the title of *Trigonometria Britannica*.

Adrian Vlacq completed *Briggs's* Table of Logarithms of Numbers by adding 70,000 numbers to the 30,000 which *Briggs* had computed, and alſo computed the logarithmic ſines and tangents for every 10 ſeconds of the quadrant, both theſe tables being carried only to 10 decimal places in the logarithms, whereas *Briggs's* logarithms went to 14 decimal places. But even a leſs number of decimal places, viz. that of 7 places, has been ſince thought ſufficient for moſt purpoſes, and particularly for aſtronomical calculations; and may ſtill be thought ſo, notwithſtanding the improved accuracy of inſtruments and the modes of obſerving; ſince they are capable of determining the place of a heavenly body from obſervation, as far as depends on the tables, to a tenth of a ſecond, while the beſt obſervations are liable to an error of 5 ſeconds or more.

Thus we are indebted to *Napier*, *Briggs*, and *Vlacq*, for their ingenious inventions and induſtrious labours in providing us with our preſent logarithmic tables, as to the ſubſtance; ſome improvements in the form and diſpoſition of them only having been introduced by later authors. *Gardiner's* Tables of Logarithms of Numbers and Logarithms of Sines and Tangents for every ten ſeconds of the quadrant, which are the moſt complete tables publiſhed ſince *Vlacq's*, are confeſſedly taken from *Vlacq's*, only abridged to 7 places of decimals. The trouble of making proportion for the intermediate ſeconds, or computing equations of 2d and 3d differences, &c. where the differences are very irregular, has alone been complained of.

To obviate theſe difficulties, the late Mr. *M. Taylor* undertook this laborious work of computing the logarithmic ſines and tangents to every ſecond of the quadrant, by interpolating *Vlacq's* logarithmic ſines and tangents, whereby

whereby he obtained a table to every ſecond, conſiſting of ten decimal places of figures, as *Vlacq's* did, which he then abridged to only 7 decimal places beſides the index, taking particular care to make the laſt figure true to the neareſt unit over or under, a circumſtance that will be found very conducive to exactneſs in ſuch caſes where an unit in the laſt place is of conſequence, and where ſeveral logarithms are added together.

Nor did the author uſe leſs care and diligence in ſuperviſing the preſs and correcting its errors. He generally examined 3 and ſometimes 4 ſucceſſive proofs with the help of an aſſiſtant, one reading while the other hearkened. The firſt proof he compared with his manuſcript, attending chiefly to the 2, 3 or 4 laſt figures, according as the differences rendered neceſſary; and further examined the index and 3 or 4 or 5 firſt decimal figures himſelf ſingly. He alſo compared the 2d proof, as to the 2, 3 or 4 laſt figures, and again as to the two laſt, with the manuſcript; then at every 36″ with *Brigg's* Trigonometria Britannica; and laſtly to every 10″ with *Vlacq's* and *Gardiner's* Tables. He further took the differences of the two laſt figures of the ſucceſſive numbers by inſpection. He examined the tangents and their correſponding cotangents by trying whether their ſum every where came out 10; and, if any difference appeared, detected where the error lay, whether in the tangents or cotangents, by the differences. By this method, and with this care, the 3d proof was generally rendered correct to the author's mind; if not another, and another were taken, till the preſs was found correct; and the ſheet was then worked off. The table of logarithms of numbers was compared in the printing with the beſt tables of logarithms, and particularly with thoſe of Dr. *Hutton's* Mathematical Tables.

The five laſt pages of the table of logarithmic ſines and tangents were all that remained unfiniſhed at the preſs when the author died. Theſe I examined carefully myſelf in the ſame manner as the author had the reſt of the work. Only I examined the tangents and cotangents, by trying whether the ſum of the correſponding figures in every place, beginning from the left, made 9, except the laſt ſignificant figures to the right which ſhould make 10; which comes to the ſame thing with the author's method.

Having been informed by the author, a ſhort time before his death, that he had diſcovered ſome errata in the tables, which he intended to correct in all the copies of the impreſſion, by eraſing the faulty figures and putting in the right ones with a printer's type and ink, I cauſed diligent ſearch to be made for them among his papers, which were at laſt happily found. To render the work complete, thoſe which affected only a ſmall part of the ſignature, which was the caſe of the greater number, have been corrected ſince in all the books, in the manner propoſed by the author; but, as it is poſſible that ſome miſtakes might be made in correcting the copies, I have ſet down thoſe errata at the end of the precepts for the uſe of the tables, that the curious calculator might be enabled to examine his book by them. It appeared too arduous an undertaking to correct the books for thoſe errata which affected the whole or a large part of the impreſſion; although the author, out of his great regard for the credit and ſucceſs of his work, intended to have done ſo; theſe errata, therefore, are inſerted at the end of the tables. On the ſame page are added ſome numbers, with their logarithms, which may be frequently wanted in calculation.

PREFACE.

I ſhall now give an account of the principal contents of the Precepts. I have firſt given an explanation of the general nature and properties of logarithms, in a manner that appeared to me the moſt ſimple and eaſy of conception. In explaining the uſe of the logarithmic tables, I have had my eye both on *Gardiner's* Precepts to his quarto book of logarithms, and Mr. *Callet's* improved explanation of them annexed to his elegant octavo edition of the ſame, entitled, *Tables Portatifs de Gardiner*. *Gardiner's* Explanation is undoubtedly too abſtracted and conciſe for the generality of perſons who are likely to make uſe of ſuch tables. Mr. *Callet's* Explanation is much preferable for common uſe, being more diffuſe, and expreſſed in common language without ſymbols. I have taken freely from both, at the ſame time adapting the explanation to the peculiar form of theſe tables, and inſerting various improvements of my own, all of which it would be too tedious to particulariſe, and will beſt appear by comparing theſe precepts with the others. I will, however, mention the principal of them

In page 17, I have pointed out the proper method of taking out the logarithmic ſine of an arc between 90° and 180° or between 270° and 360°, directly, without taking the complement of the arc; and in like manner in page 21 to find the arc directly from its logarithm. In page 17 will be found eaſy and accurate rules to find the logarithmic ſine or tangent of a ſmall arc, or the logarithmic coſine or cotangent of one near 90°; and in like manner will be found in page 22 rules to find a ſmall arc from its logarithmic ſine or tangent, or an arc near 90° from its logarithmic coſine or cotangent, where by the common rule it would have been neceſſary to have applied equations of ſecond and perhaps higher differences, which would have been attended with conſiderable trouble to the calculator. In page 28 and 29 are given two new rules for finding the logarithm of a decimal fraction, one to be uſed with negative indices and the other with affirmative ones by adding 10 to the index. I have taken the ſubſtance of the rule of proportion from Mr. *Callet*, which is much clearer than as it ſtands in *Gardiner's* precepts. The rule for the combination and arbitration of exchange is chiefly taken from Dr. *Hutton's* arithmetic. Mr. *Jones's* 20 caſes of compound intereſt, and 5 others following, and that in article 10, which are all given in *Gardiner*, and 5 others by Mr. *Callet*, are here computed by a new method, by firſt finding certain arcs from the things given, and thence computing the things required by theorems equivalent to but much more ſimple than the uſual expreſſions for the ſame, and better adapted to logarithmic calculation. I have choſen here, as well as in ſome other places, to give the rules and theorems themſelves in algebraic language, rather than as applied to logarithmic calculation, that the reader might ſee more clearly the ground and reaſon of what he is about; after which he will be at no loſs to make the calculation by logarithms.

General properties of plane triangles, right-angled ſpheric triangles, oblique-angled ſpheric triangles, and rectilateral ſpheric triangles, or having one of the ſides equal to 90°, are prefixed to the reſpective ſolutions of the ſame; as well to explain the reaſon of the ſolutions, as to give the reader information which may be uſeful to him on other occaſions. I have given tables of the ſolutions of the ſeveral caſes of plane and ſpheric triangles by analogies, and with reference to ſchemes, in the uſual manner, and added rules to point out whether the things found are greater or leſs than 90°, and not left it to the reader to ſupply ſo neceſſary a part of the ſolution from his own conſideration and contemplation of the ſcheme and the general doctrine of triangles, as has been cuſtomary with trigonometrical writers, which might often take up much time, and ſometimes occaſion miſtakes. A diſtinct table of ſolutions of the caſes

caſes of a rectilateral ſpheric triangle is here given, which has not, that I know of, been done before, being analogous to the table of caſes of a right-angled ſpheric triangle, of which this rectilateral triangle is the ſupplemental one.

Not content with giving the ſolutions of ſpheric triangles by analogies, I have given them over again in another manner, directly adapted to practice, by theſe tables of logarithmic ſines and tangents to every ſecond of the quadrant. I had two views in this, firſt to render the calculation more ready and eaſy, and ſecondly to introduce ſome new improvements, in order to make the calculation univerſally accurate in all caſes, whereas the common rules frequently fail, which however is a circumſtance not generally adverted to, nor hitherto much taken notice of.

The failure of the common rules ſometimes ariſes from the ſmallneſs or even vaniſhing of the difference of the logarithmic ſines for a difference of a ſecond in the arc near the end of the quadrant, or of the coſine near the beginning of it; and ſometimes from a contrary cauſe the largeneſs of the difference of the logarithms.

To obviate the error in finding an arc ariſing from the ſmallneſs of the logarithmic difference of its ſine or coſine, a new and accurate rule has been laid down to be made uſe of in that caſe. The error ariſing from the largeneſs of the logarithmic difference happens only when the firſt arc is not computed to a ſmall enough fraction of a ſecond to deduce the ſine or coſine of the ſame arc with accuracy in the ſecond operation; this error will be prevented by finding the arc with at leaſt as many decimal places of a ſecond as the logarithmic difference has places. But there is another method recommended to be purſued in this caſe, attended with ſuperior advantages, namely, to derive the ſine or coſine, or their arithmetical complement, for the uſe of the ſecond operation, from the tangent or cotangent of the firſt arc, which is already found, and the coſine of the ſame, if the ſine ſhould be uſed by the common rule, or the ſine if the coſine ſhould be uſed by the common rule, taken out of the table, whoſe logarithmic difference will be ſmaller than that of the ſine or coſine required by the common rule, and conſequently eaſier taken out of the table. The advantage attending theſe methods is ſo great, that if proportion be made for the differences the reſult will be obtained true in moſt caſes within a tenth of a ſecond, and in any caſe the error will not be greater than what might ariſe from that of a tenth of a ſecond in any of the data; and in moſt practical caſes, if the exactneſs of only a ſecond or a ſecond and half be required, the making any proportions at all for the differences may be diſpenſed with, and the logarithms may be taken out at ſight to the neareſt ſecond of the arc, and the arc to the neareſt ſecond from the logarithm, which will much ſimplify and ſhorten the calculation.

Next follow the ſolutions of fifteen uſeful problems. The ſecond and third of theſe, which are to find the logarithm of the ſum or difference of two numbers, whoſe logarithms are given, are taken from Mr. *Cagnoli's* uſeful treatiſe of plane and ſpheric trigonometry. The following problems, from the third to the eighth, are ſolved according to the ſame principles. The eighth and ninth problems are ſubſervient to the ſolution of the eleventh problem or of cubic equations. The ninth contains the ſolution of a famous problem, that of finding any power of an impoſſible binomial in terms of another impoſſible binomial,

mial, which I have derived from the analogy of the circle to the equilateral hyperbola. There is ſomething of this kind propoſed and partly executed by Mr. *De Moivre*, at the end of *Sanderſon's* Algebra. His extraction of the cubic root of an impoſſible binomial is juſt and complete, but not ſo ſimple as what is here given. His rule for extracting any root out of any given power of an impoſſible binomial gives rightly the poſſible part of the binomial required, but leaves the impoſſible part undetermined.

The thirteenth and fourteenth problems will, I hope, be found of conſiderable uſe in practical aſtronomy, being more clear and preciſe than any rules I have ſeen for the ſame purpoſe, and at the ſame time capable of giving the reſult true to a ſecond or little more, in the caſe of the planets or zodiacal ſtars, by only taking out the logarithms for the neareſt ſecond of an arc, and the arc to the neareſt ſecond anſwering to the logarithms.

The fifteenth or laſt problem, to clear the obſerved diſtance of the moon from the ſun, or a fixed ſtar, of the effects of refraction and parallax, is one of the moſt important in practical navigation, on account of its great uſe in finding the longitude at ſea. Its ſolution here given is new, and preferable to *Dunthorne's* improved, contained in the ſecond edition of the Requiſite Tables uſed with the Nautical Ephemeris. Beſides theſe tables of logarithmic ſines and tangents, it requires only the tables of refraction and of the ſun's parallax, or the firſt and third of the Requiſite Tables. It will be ſufficient to take out the logarithmic ſines and tangents as they ſtand in the table oppoſite the arc, taken to the neareſt ſecond, and the arc to the neareſt ſecond anſwering to the logarithm, which will make the calculation very eaſy.

NEVIL MASKELYNE.

GREENWICH,
January 14th, 1793.

MATHEMATICS

THE

EXPLANATION AND USE

OF THE

LOGARITHMIC TABLES.

THE nature and properties of Logarithms may be eaſily explained, in the following manner:

Let $1 : 1+e : \overline{1+e}^2 : \overline{1+e}^3$ &c. indefinitely continued be a geometrical progreſſion beginning from unity, in which the common ratio is $1 : 1+e$, and e is indefinitely ſmall; or the ratio $1 : 1+e$ is indefinitely near to that of equality. It is evident that ſome term or other of the progreſſion will be equal to, or coincide with each term of the ſeries of natural numbers, 1, 2, 3, 4, &c. as well as to every other intermediate mixt number conſiſting of a whole number with a decimal annexed. The products of the given quantity e multiplied by the indices of the ſeveral terms of the geometric ſeries are called the hyperbolic logarithms of the numbers to which the terms themſelves are equal. Thus $e \times 1 = e$ is the hyperbolic logarithm of the number $1+e = \overline{1+e}^1$ whoſe index is 1; $e \times 2 = 2e$ is the hyperbolic logarithm of the number $\overline{1+e}^2$ whoſe index is 2; and, generally, $e \times n = ne$ is thehyperbolic logarithm of $\overline{1+e}^n$ whoſe index is n; and $e \times o$ or o is the hyperbolic logarithm of $1 = \overline{1+e}^o$ whoſe index is o.

Hence the hyperbolic logarithms being proportional to the indices of the powers muſt have ſimilar properties; And as

$\overline{1+e}^2 \times \overline{1+e}^3 = \overline{1+e}^5$; ſo $\log. \overline{1+e}^2 + \log. \overline{1+e}^3 = \log. \overline{1+e}^5 = 5e$

$\frac{\overline{1+e}^5}{\overline{1+e}^3} = \overline{1+e}^2$; ſo $\log. \overline{1+e}^5 - \log. \overline{1+e}^3 = \log. \overline{1+e}^2 = 2e$

$\overline{\overline{1+e}^2}^3 = \overline{1+e}^{2\times 3} = \overline{1+e}^6$; ſo $3 \times \log. \overline{1+e}^2 = \log. \overline{1+e}^6 = 3 \times 2 \times e = 6e$

$\sqrt[3]{\overline{1+e}^6} = \overline{1+e}^{\frac{6}{3}} = \overline{1+e}^2$; ſo $\log. \overline{1+e}^{\frac{6}{3}} = \frac{\log. \overline{1+e}^6}{3} = \frac{6}{3} \times e = 2e$

$\overline{1+e}^m \times \overline{1+e}^n = \overline{1+e}^{m+n}$; ſo $\log. \overline{1+e}^m + \log. \overline{1+e}^n = \log. \overline{1+e}^{m+n} = \overline{m+n} \times e$

$\frac{\overline{1+e}^m}{\overline{1+e}^n} = \overline{1+e}^{m-n}$; ſo $\log. \overline{1+e}^m - \log. \overline{1+e}^n = \log. \overline{1+e}^{m-n} = \overline{m-n} \times e$

$\overline{\overline{1+e}^m}^n = \overline{1+e}^{m\times n} = \overline{1+e}^{mn}$; ſo $\log. \overline{\overline{1+e}^m}^n$ or of $\overline{1+e}^{mn} = m \times n \times e = mne$

$\sqrt[n]{\overline{1+e}^m} = \overline{1+e}^{\frac{m}{n}}$; ſo $\log. \sqrt[n]{\overline{1+e}^m}$ or of $\overline{1+e}^{\frac{m}{n}} = \frac{\log. \overline{1+e}^m}{n} = \frac{m}{n} e$

But

But the geometric ſeries muſt be carried backwards, as well as forwards, in order to include numbers leſs than unity, as well as thoſe that are greater; and the ſeries will ſtand thus:

The Numbers, &c. $\overline{1+e}^{-3}$, $\overline{1+e}^{-2}$, $\overline{1+e}^{-1}$, $\overline{1+e}^{0}$, $\overline{1+e}^{1}$, $\overline{1+e}^{2}$, $\overline{1+e}^{3}$, &c.

Their Logarithms, &c. $-3e$, $-2e$, $-e$ 0 e. 2e. 3e &c.

where it is evident, when the indices become negative, the terms of the progreſſion will expreſs numbers leſs than unity; and their logarithms, like their indices, will become negative alſo.

As the products of the given quantity e, multiplied by the indices of the terms of the progreſſion, are the hyperbolic logarithms of the terms, and have properties ſimilar to thoſe of the indices; ſo if theſe logarithms be multiplied by any given quantity v, they will have ſimilar properties to what they had before, or become logarithms of a new ſcale; which, as v is variable at pleaſure, admits of infinite variety. If v be taken = 0,4342945 &c. then 0,4342945, &c. × e × into the indices of the terms of the geometric progreſſion before given, will be the common or Briggian logarithms of the terms, and the logarithm of 1 + e, which exceeds 1 by the indefinitely ſmall quantity e, will be equal to 0,4342945 &c. × e; and the logarithm of 10 will come out equal to unity; which renders this ſcale the moſt convenient for common uſe, as being beſt adapted to our decimal ſcale of arithmetic, and has been the reaſon for the adoption of it in preference to the hyperbolic logarithms firſt invented by Baron NAPIER.

The quantity e being indefinitely ſmall, n muſt be indefinitely great, to make $\overline{1+e}^{n}$ exceed unity by a finite difference, or to repreſent any of the natural numbers greater than unity. But this expreſſion may be transformed into another, which contains only finite quantities. Thus putting $n = \frac{m}{e}$ where m is a finite quantity, we ſhall have $\overline{1+e}^{n} = \overline{1+e}^{\frac{m}{e}} = \overline{\overline{1+e}^{\frac{1}{e}}}^{m} = a^{m}$, putting the given quantity $\overline{1+e}^{\frac{1}{e}} = a$. It may be obſerved, that the quantity $\overline{1+e}^{\frac{1}{e}}$ is that whoſe hyperbolic logarithm is $= \frac{1}{e} \times e = 1$. Its quantity is found by the binomial theorem $= 1 + 1 + \frac{1}{2} + \frac{1}{2.3} + \frac{1}{2.3.4}$ &c. = 2,7182818 &c. whoſe ratio to unity has been called by Mr. Cotes the modular ratio, becauſe its logarithm taken in any ſyſtem is the modulus of that ſyſtem. Thus $\overline{1+e}^{\frac{m}{e}} = a^{m}$ is the number whoſe hyperbolic logarithm is $n e = \frac{m}{e} \times e = m$, or common logarithm equal to v m.

This might alſo be deduced from the general properties of logarithms. For, in every ſcale, the logarithm of $b^m = m \times$ logarithm of b; and therefore if b be taken equal to the number whoſe logarithm of that ſcale is equal to unity, the logarithm of b^m will be equal to m. Hence, if b repreſent the number 2,7182818 &c. above-mentioned, whoſe hyperbolic logarithm is equal to unity, the hyperbolic logarithm of b^m will be equal to m. And if b repreſent 10, the number whoſe Briggian or common logarithm is unity, the logarithm of b^m or 10^m will be m; that is, the common logarithm of any number is the index of that power of 10, which is equal to the number. Thus, the logarithm of 10 or $\overline{10}^{1}$ is 1; that of $100 = \overline{10}^{2}$ is 2; that of $1000 = \overline{10}^{3}$ is 3; the logarithm of $2 = \overline{10}^{0,3010300}$ is 0.3010300; the logarithm of $20 = \overline{10}^{1,3010300}$ is 1.3010300; and if any number be $= \overline{10}^{\pm n}$ its logarithm will be ± n.

Hence

Hence, the terms of the decimal ſeries of numbers

$$\text{----}\overline{10}^{3};\ \overline{10}^{2};\ \overline{10}^{1};\ \overline{10}^{0};\ \overline{10}^{-1};\ \overline{10}^{-2};\ \overline{10}^{-3}$$

or 1000 ; 100 ; 10 ; 1 ; 0,1 ; 0,01 ; 0,001 have their logarithms reſpectively

$$+3\ ;+2\ ;+1\ ;\ 0\ ;-1\ ;-2\ ;\ -3$$

The logarithm of any intermediate number, between any two neareſt terms of the ſeries above, conſiſts of the exponent of the ſecond of the two terms, which may be either poſitive or negative, and a decimal fraction, which is always poſitive, unleſs otherwiſe declared. Thus the logarithm of 756, which lies between 1000 or $\overline{10}^{3}$ and 100 or $\overline{10}^{2}$ is $2 + 0.8785218$ or 2.8785218. The logarithm of 0,0756 which lies between 0,1 or $\overline{10}^{-1}$ and 0,01 or $\overline{10}^{-2}$ is $-2 + 0.8758218$. And generally the logarithm of a number a lying between $\overline{10}^{\pm n+1}$ and $\overline{10}^{\pm n}$ is $\pm n + A$, where A is a decimal fraction. The exponent n is called the index or characteriſtic of the logarithm of a, and is always a whole affirmative or negative number, or zero, and ſhews the diſtance of the firſt ſignificant figure of the number a from the place of units, either above or below it.

The negative index of a logarithm, whoſe decimal part is poſitive, as uſual, is beſt diſtinguiſhed by the negative ſign placed above the index; thus the logarithm $-n + A$ will be expreſſed by $\overline{n} + A$; and the logarithm $-2 + 0.8785218$ will be expreſſed by $\overline{2}.8785218$; and if this diſtinction be well obſerved, the negative ſign prefixed to the index may then be uſed to ſignify the whole logarithm, both index and decimal part to be negative, as in the logarithm -1.1214782 which is the ſame as the former only reduced to this form, as will be ſhewn below.

The characteriſtics of the logarithms being thus eaſily determined, upon ſimple inſpection of the numbers whoſe logarithm are ſought, are not expreſſed in theſe Tables. The decimal fraction, or other part of the logarithm (which is what theſe Tables exhibit) is always affirmative. Nevertheleſs, when the index is negative, if any one chuſes to make the whole logarithm of one kind, that is wholly negative, which may ſometimes be uſeful, eſpecially in raiſing powers, it is eaſily done, by adding an affirmative unit to the negative index (which is the ſame thing as leſſening the negative index by a unit), and inſtead of the decimal part putting down its arithmetical complement. Thus the logarithm of 0,0756 being $-2 + 0.8785218, = \overline{2}.8785218$, if $+1$ be added to its index -2, and the arithmetical complement of the decimal part be taken $= 1 - 0.8785218 = 0.1214782$, will become -1.1214782, which is wholly negative. The arithmetical complement is eaſily found, by ſubtracting each figure ſeparately from 9, only ſubtracting the laſt ſignificant figure from 10, and putting down the remainders in order. Generally, if the logarithm be $-n + A, = \overline{n} + A$, make the new index $= -n + 1$, and the new decimal fraction or complement of $A = -1 + A$, and both the index and decimal fraction will be negative, to which prefix the common ſign of negation, and you have the logarithm of a wholly negative $= \overline{-n+1}\,\overline{-1+A} = -\left(\overline{n-1} + \overline{1-A}\right)$.

But

But it is more generally uſeful to put theſe logarithms of decimal fractions under a poſitive form, by borrowing 10 to the index, or in ſome caſes 100 or 1000; which is done by only ſubſtituting for the index its arithmetical complement to 10 or 100, &c. as the caſe may require. Thus, inſtead of $\bar{2}.8785218$ we may take 8,8785218 or 98,8785218 or 998,8785218 &c. We muſt remember, however, to ſubtract the 10 borrowed in the place of the index from the reſulting logarithm, at the end of any operation where ſuch transformed logarithm is employed; and, if the reſulting index ſhould then be leſs than 10, to put the firſt ſignificant figure of the correſponding natural number as much below the place of units as the reſulting index wants of 10. Thus, if the reſulting logarithm ſhould be 13.7951846, diminiſh its index by 10, the remainder 3,7951846 will be the proper logarithm, whoſe natural number is 6240; but if the reſulting logarithm be 7.7951846, whoſe index is leſs than 10 by 3, the natural number will be 0,00624, whoſe firſt ſignificant figure 6 is depreſſed 3 places below the place of units.

Becauſe multiplying or dividing any number by 10, 100, 1000, &c. only adds 1, 2, 3, &c. to the index of its logarithm, or diminiſhes it as much; therefore the decimal part of the logarithm is not varied by ſhifting the decimal point or comma of any given number, the index only ſuffering an increaſe by as many units as the point is ſhifted to the right, or a diminution by as many units as the point is ſhifted to the left. It is, from this property of the common logarithms, that one table of them, carried up ſuppoſe to 100000 natural numbers, with their correſpondent logarithms to 7 decimal places of figures, will expreſs the logarithms of any numbers *ad infinitum* true to the ſame number of decimal places, by only varying the index, and thereby becomes in effect an infinite table, which renders theſe logarithms ſo valuable; which is not the caſe of the hyperbolic logarithms, where multiplication or diviſion by 10, 100, 1000, &c. cannot be performed without adding or ſubtracting the hyperbolic logarithms of thoſe numbers. Thus, if the number 54321 be varied, by changing the poſition of the decimal point, the index of the correſponding logarithm will vary accordingly, the decimal part continuing the ſame, as follows:

Numbers.	Logarithms.	Logarithms of Decimal Fractions borrowing 10.
54321	4.7349678	
5432,1	3.7349678	
543,21	2.7349678	
54,321	1.7349678	
5,4321	0.7349678	
0,54321	$\bar{1}$.7349678	9.7349678

The PROPERTIES of LOGARITHMS.

LET a, b, c, &c. be any numbers; and L. a; L. b; L. c, &c. their Logarithms; and L′. a; L′. b; L′. c, &c. the complements of their logarithms to zero, or = o — L. a; o — L. b; o — L. c, reſpectively, which follows from the ſuppoſition that L′a + L. a = L. 1 = o Then

1 L. a + L. b = L. a × b = L. a b.

L. 3 + L. 5 = L. 3 × 5 = L 15

L. a + L. b + L. c + L. d = L. a × b × c × d = L. a b c d.

L. 3 + L. 5 + L. 7 + L. 11 = L. 3 × 5 × 7 × 11 = L. 1155

2 L $\frac{a}{b}$ = L. a — L. b = L. a + L′. b.

L $\frac{3}{5}$ = L. 3 — L 5 = L 3 + L′. 5.

L $\frac{1}{a}$ = L. 1 — L. a = o — L. a = L′. a

L $\frac{1}{3}$ = L. 1 — L 3 = o — L. 3 = L′. 3.

3 L. a^n = n L. a; L. $a^{\frac{1}{n}}$ = $\frac{1}{n}$ L. a; L. $a^{\frac{m}{n}}$ = $\frac{m}{n}$ L. a.

L 3^9 = 9 L. 3; L. $3^{\frac{1}{9}}$ = $\frac{1}{9}$ L. 3; L. $3^{\frac{4}{9}}$ = $\frac{4}{9}$ L. 3

L. $\frac{1}{a^{\frac{m}{n}}}$ = $\frac{m}{n}$ L′. a

4 L $\left.\overline{\frac{a}{b}}\right|^{\frac{m}{n}}$ = $\frac{m}{n}$ L. $\frac{a}{b}$ = $\frac{m}{n}$ × $\overline{\text{L. a} - \text{L. b}}$ = $\frac{m}{n}$ × $\overline{\text{L. a} + \text{L′. b}}$

L $\left.\overline{\frac{3}{5}}\right|^{\frac{4}{9}}$ = $\frac{4}{9}$ L. $\frac{3}{5}$ = $\frac{4}{9}$ × $\overline{\text{L. 3} - \text{L. 5}}$ = $\frac{4}{9}$ × $\overline{\text{L. 3} + \text{L′. 5}}$

5 L. $\frac{a^m b^n c^t}{p^v q^x r^z}$ = m L. a + n L. b + t L. c — v L. p — x L. q — z L. r = m L. a + n L. b + t L. c + v L′. p + x L′. q + z L′. r

L. $\frac{3^4 \times 5^9 \times 7^2}{12^6 \times 13^8 \times 14^{10}}$ = 4 L. 3 + 9 L 5 + 2 L. 7 — 6 L. 12 — 8 L. 13 — 10 L. 14 = 4 L. 3 + 9 L. 5 + 2 L. 7 + 6 L′. 12 + 8 L′. 13 + 10 L′. 14.

The complement to *zero*, or ſimply the complement of a number, is what muſt be added to the number to produce zero. Although the complement of a number, and what is called its arithmetical complement, come to the ſame thing in practice, when properly underſtood, we ought not to confound one with the other.

The arithmetical complement of a number, is what we muſt add to a number to produce not *zero*, but an unit of a certain place, generally one higher than that of the firſt ſignificant place of the number, when it is a whole number or a fraction; but when it is a fraction, the practice is to take its complement to unity.

For *Example:*

The arithmetical complement of	769 is	1000 — 769	or 231
Its complement to *zero* - - -	is	0 — 769	or 231 — 1000
The arithmetical complement of	76,943 is	100 — 76,943	or 23,057
Its complement to *zero* - - -	is	0 — 76,943	or 23,057 — 100
The arithmetical complement of	0,76943 is	1 — 0,76943	or 0,23057
Its complement to *zero* - - -	is	0 — 0,76943	or 0,23057 — 1

When two numbers are complements of one another, the numbers to which they correſpond are reciprocals of one another; that is, the ratio of the firſt to unity is the inverſe or reciprocal of the ratio of the ſecond to unity. Thus 7 and $\frac{1}{7}$ are reciprocal, becauſe $\frac{1}{7}$: 1 is inverſely or reciprocally as 7 : 1. If L. a + L. b = 0 = L. 1, we ſhall have ab = 1, and $b = \frac{1}{a}$. Whence we ſee that the logarithm of a number is equal to that of its reciprocal, but with a contrary ſign; and that the logarithm of the reciprocal of a number is the complement of its logarithm. It may therefore be often convenient, inſtead of a logarithm, to make uſe of its complement, which may be readily found: thus,

Increaſe the index by 1; that is, if it is poſitive, augment it by a poſitive unit, and if it is negative, diminiſh it by a negative unit; then change its ſign, and put down what each of the following figures of the decimal part wants of 9, only what the laſt ſignificant figure wants of 10; but, if the decimal part is equal to nothing, only change the ſign of the index. See the following *Examples:*

L. 8 = 0. 9030900. L $\frac{1}{8}$ or L′. 8 = $-\overline{1}$. 0969100. 0969100 = 9. 0969100 = — 0. 9030900
L. 8000 = 3. 9030900. L′. 8000 = $-\overline{4}$. 0969100. 0969100 = 6. 0969100 = — 3. 9030900
L. 1000 = 3. 0000000. L′. 1000 = $-\overline{3}$. 0000000. 0000000 = 7. 0000000 = — 3. 0000000
L. 54321 = 4. 7349678. L′. 54321 = $-\overline{5}$. 2650322. 2650322 = 5. 2650322 = — 4. 7349678

The arithmetical complement of any number is eaſily found, by writing down what each of its figures wants of 9, except of the laſt ſignificant figure to the right, whoſe difference from 10 is to be ſet down.

The complement of a number being equal to the number with a contrary ſign, it follows, that the complement of the logarithm of a decimal fraction becomes the negative logarithm of this fraction, or of any vulgar fraction equal to it.

EXPLANATION of the TABLE of LOGARITHMS of NUMBERS.

THIS Table conſiſts of two parts, or two tables; both of which together contain the decimal part of the logarithms of all numbers, from 1 to 100999. The firſt, or particular table, and which occupies the two firſt pages, contains the decimal part of the logarithm of the numbers from 1 to 1260; and the ſecond, or general table (which is much more extenſive, and occupies the remaining pages) contains the decimal part of the logarithm of numbers, from 10000 to 100999. The logarithmic decimal, aſſigned

to

to the firſt 1260 numbers, in the beginning of the table, and to the numbers, from 100000 to 100999, at the end of the table, conſiſts of eight places of figures; but in the reſt, or intermediate and greater part of the table, only of ſeven places of figures. In the firſt two pages, or firſt table, the natural numbers are contained in the columns marked N (the initial of Natural), and the logarithmic decimal in the adjacent column, marked Logar. (for Logarithms), and anſwering to the number preceding it in the ſame horizontal line. In the ſecond, or general table, the four firſt figures of the natural numbers, from 10000 to 100000, are contained in the column marked N at the top, and the fifth figure (including the cypher as one), at the top and bottom of the ten following columns. The logarithmic decimal of all theſe numbers is inſerted in the ſaid ten columns, intitled 0, 1, 2, 3, &c. both at top and bottom, viz. the three firſt figures in the beginning of the ſecond column, and the four laſt figures on the right hand ſide of the ſame column adjoining to the three firſt figures, and in the other nine columns intitled 1, 2, 3, &c. This is to be underſtood with reſpect to the numbers from 10000 to 100000; but from 100000 to 100999 the logarithmic decimal conſiſts of eight places, as before-mentioned; the four firſt figures of which, being common to all the columns, are contained in the beginning of the ſecond column, and the four laſt figures on the right hand ſide of the ſecond column and in the nine following columns. This being what is called a table of double entry, is entered with the four or five firſt figures of the natural number in the firſt column, and the fifth or ſixth figure at the top or bottom of one of the ten following columns; at the common meeting of the vertical and horizontal lines the four laſt decimals of the logarithm will be found, to which muſt be prefixed the three or four firſt figures from the beginning of the ſecond column.

The three or four firſt logarithmic figures continuing the ſame, for ſeveral lines together, it has been uſual to ſet them down only once in the tables, namely, where they firſt begin to take place in the ſecond column; they are therefore to be underſtood as if they had been repeated, or the beginning of the ſecond column filled up with them, till a new ſet of three or four firſt figures, greater by one than the former, takes place; or, which comes to the ſame thing, the three or four firſt logarithmic figures, if not found againſt the given number, will be the firſt that occur above, except in part of the line immediately preceding a new ſet of three or four firſt figures, where the four laſt figures begin with a cypher, or any leſs figure than the laſt four in the ſecond column, in which caſe the three or four firſt figures are to be taken from the beginning of the ſecond column in the line immediately below.

The index to the logarithms has been omitted, as being eaſily ſupplied, and better ſo than if it had been inſerted in the table, being equal to the diſtance of the higheſt figure of the natural number from the place of units, and poſitive if to the left, negative if to the right. It will therefore vary according as the number, if not all integral, is divided by the decimal point or comma, into integers and decimals; whereas the decimal part of the logarithm depends only on the figures of which the number is compoſed, conſidered all together as an integer. Otherwiſe, the logarithmic decimal contained in the table truly

expreſſes

expreſſes the logarithm of the natural number, ſuppoſing its firſt or higheſt figure to occupy the place of units, and the remaining figures to be decimals. Thus the logarithm of 9,83 is 0. 99255352, found in the table oppoſite 983; and the logarithm of 1,0194 is 0. 0083446, ſtanding in the table oppoſite 10194. So that inſtead of putting an index to the logarithm in the table, we ſhould rather put a decimal point or comma to the natural number, to ſeparate its firſt figure from the reſt. But both diſtinctions are unneceſſary.

If the natural number, whoſe logarithm is required, conſiſts of more than five places of figures, a proportional addition muſt be made to the logarithm contained in the table; therefore immediately after the logarithms are placed ſmall tables of proportional parts of the difference of the logarithms, anſwering to the figures 1, 2, 3, &c. in the ſixth place of the natural number, or $\frac{1}{10}$, $\frac{2}{10}$, $\frac{3}{10}$, &c. of the difference. The number at the head of the column ſignifies the difference of two ſucceſſive logarithms in the table, and is placed to anſwer as near as poſſible to the logarithms to which it belongs in the ſame horizontal line. To find what particular ſmall table ſhould be made uſe of, the difference of the ſucceſſive logarithms may be taken, or it may be ſufficient to take only their difference in the place of units, for the other figures of the difference will immediately appear at the head of the ſmall table by the ſide.

USE of the TABLE of LOGARITHMS.

PROBLEM I.

To find the Logarithm of any given Number by the Tables.

LET the firſt ſignificant figure of the number occupy whatever place it will, in the firſt inſtance conſider the number as an integer, remembering only that the proper index is to be aſſigned to the logarithm, after its decimal part ſhall have been found, in the manner before-mentioned.

CASE I. If the number does not exceed 1260, look for it in one of the columns marked N in one of the two firſt pages, or firſt Table, its logarithmic decimal to eight places of figures is even with it in the adjacent column marked Logar. Thus the logarithmic decimal of the number 1023 is .00987563, and the logarithm of 1023 is 3. 00987563, and that of 102,3 is 2. 00987563.

CASE II. If the given number is between 1000 and 10100, look for it in the firſt column of the reſt of the table, or general table, after the two firſt pages, and in the adjacent column marked 0, you will find its logarithmic decimal, the three or four firſt figures of which, when not ſtanding even in a line with the given number, muſt be taken from the firſt which occur above. From 1000 to 10000 the logarithmic decimal conſiſts of ſeven places of figures, but from 10000 to 10099 it conſiſts of eight places. Thus the logarithm of 4627 is 3. 6652995; and that of 46,27 is 1. 6652995, and that of 100,76 is 2. 00328816.

CASE

CASE III. If the number is between 10000 and 100000, or consists of five places of significant figures, look for the first four figures in the column marked N, and the fifth figure at the top or bottom of one of the ten following columns; then in this column, and even with the four first figures of the number, you will find the four last figures of the logarithm; and you will find its three first figures at the beginning of the second column, either even with the first four figures of the number, or the first which occur above; except in part of the line, immediately preceding a new set of the first three figures, where the four last figures begin with a cypher, or any less figure than the last four in the second column, and then the three first figures are to be taken from the beginning of the second column in the line below. Thus the logarithm of 546,74 is 2. 7377808, and that of 73, 284 is 1. 8650092. If the number was between 100000 and 101000, its logarithm might be found in like manner; thus the logarithm of 1005, 93 is 3. 00256776, and that of 10, 0767 is 1. 00331833.

CASE IV. If the number is between 100000 and 1000000, or consists of six significant figures, seek for the logarithmic decimal answering to the first five figures, take the difference of the logarithms, with which enter one of the small tables of proportional parts at top, and with the sixth figure of the given number on the side; the correspondent proportional part added to the logarithmic decimal belonging to the five first figures of the number will be the logarithmic decimal of the given number. *Example:* Let the logarithm of 67832, 3 be required. The logarithmic decimal of 67832, or the five first figures is .8314346, the difference between which and the next greater logarithm in the table is 64; the column so intitled, even with 3, the sixth figure of the number, gives the proportional part 19, which added to the logarithmic decimal .8314346 gives .8314365, therefore the true logarithm of 67832, 3 is 4. 8314365. If the number was greater than 1000000 and less than 1010000, its logarithm would be found in the same manner. *Example:* Let the logarithm of 1008, 764 be required. The logarithmic decimal of 100876 is .00378785, the logarithmic difference is 431, with which entering the small table on the side even with 4 the last figure of the number, I find 172, which I add to .00378785 and supplying the index, I have 3. 00378957 the true logarithmic decimal of 1008,764.

CASE V. If the number consists of seven or eight significant figures, seek for the logarithmic decimal answering to the first five figures, and with the logarithmic difference at the top of one of the small tables, and with the sixth, seventh, and eight figures of the number on the side, take out successively the proportional parts; the first proportional part, with one-tenth of the second, and one-hundredth of the third, added to the logarithmic decimal before found, will give the logarithmic decimal of the given number. Otherwise, and rather more exactly, multiply the logarithmic difference by the figures following the first five figures, considering them as a decimal fraction; the proper product, that is, what remains after as many figures are cut off to the right as there were figures in the decimal multiplier, will be the proper proportional part to be added to the logarithmic decimal answering to the first five figures. *Example:* Let the logarithmic decimal of 276358, 49 be required. The logarithmic decimal of 27635, or the five first figures, is by the table .4414595, the difference between which and the next greater logarithm in the table is 157. The column so intitled entered with 8, 4, 9, viz. the

c sixth,

sixth, seventh, and eight figures of the number successively on the side, gives 126, 63, and 141 but only the tenth of the second proportional part is to be taken, viz. 6, 3, and one-hundredth of the third proportional part, or 1,41 ; therefore 126 and 6, 3 and 1,41 added to .4414595 and the index being supplied, gives 5·4414729 the logarithm of 276358, 49. Otherwise, multiply the logarithmic difference 157 by .849, the sixth, seventh, and eighth figures of the number considered decimally, the product will be 133, 293, from which reject the three last figures because there were three in the multiplicator, the remainder 133 will be the true proportional part, which added to .4414595 and the index being supplied, gives 5.4414728 the true logarithmic decimal of 27635849, and more correct than that found by the table of proportional parts, from which it however differs only by 1 in defect.

CASE VI. If the number is a fraction, subtract the logarithm of the denominator from the logarithm of the numerator, the remainder will be the logarithmic of the number required ; where, it is evident, the index of a proper fraction will be negative. Or, if you should chuse to avoid negative indices, subtract the logarithm of the denominator of a proper fraction from the logarithm of the numerator increased by 10 in place of the index, the remainder will be the logarithm of the fraction, under a positive form.

If a mixed number be given, consisting of an integer and a fraction, reduce the mixed number to an improper fraction, and subtract the logarithm of the denominator from the logarithm of the numerator, the remainder will be the logarithm of the mixed number. If the proper fraction, improper fraction, or mixed number be easily convertible into a terminating decimal, convert it so, and take its logarithm. *Examples:* 1. Let the vulgar fraction, whose logarithm is sought, be $\frac{2}{3}$. From 0. 3010300 or the logarithm of 2, subtract 0. 4771213 or the logarithm of 3, the remainder $\overline{1}$. 8239087 is the logarithm of the fraction, whose index is negative. Or adding 10 to the index of the logarithm of the numerator, from 10. 3010300 subtract 0.4771213. the remainder 9.8239087 is the logarithm of the fraction under a positive form. 2. Required the logarithm of $3\frac{16}{113}$? This turned into an improper fraction becomes, $\frac{355}{113}$. From the logarithm of 355 which is 2. 55022835 subtracting that of 113 which is 2. 05307844, the difference is 0.49714991 the logarithm required. 3. The logarithm of $\frac{1}{5}$ or 0. 2 is $\overline{1}$. 3010300 or 9. 3010300. The logarithm of $\frac{3}{4} = 0,75$ is $\overline{1}$. 87506126 or 9. 87506126. The logarithm of $\frac{7}{8} = 0,875$ is $\overline{1}$. 94200805 or 9.94200805.

CASE VII. If the given number is a decimal fraction, seek for its logarithm as if it was a whole number, and apply the proper characteristic to it. *Examples:* The logarithm of 0, 76134 is $\overline{1}$.8815786 or 9. 8815786. The logarithm of 0, 076134 is $\overline{2}$. 8815786 or 8. 8815786. The logarithm of 0, 0076134 is $\overline{3}$.8815786 or 7. 8815786.

CASE VIII. If the given number consists of a finite part and an infinite recurring series, consider the finite part together with the first recurring period as an integer, from which subtract the finite part taken as an integer by itself; add the logarithm of the remainder to the arithmetical complement of the

the logarithm of as many nines as the recurring period has figures (which may be found on the page at the end of the logarithmic Sines and Tangents) and subtract 10 from the index, and you will have the logarithm required, in case the finite part is an integer; but if the finite part be not an integer, increase or diminish the index so found as much as the decimal point or comma falls to the right or left of the last figure of the finite part; or else settle the index, as usual, with reference to the position of the decimal point or comma in the given number, that is equal to the distance of its first figure from the place of units, positive if it falls to the left, negative if it fall to the right. *Example*: Let the logarithm of the number 320676, 7 &c. be required, where the infinite recurring series is distinguished from the finite part by points placed over its figures. I consider the finite part 320 with the first recurring period 67 or 32067 as an integer, from which I subtract the finite part 320 taken as an integer by itself; the remainder is 31747, whose logarithm 4. 5017027 I add to the arithmetical complement of the logarithm of 99 or two nines, because there are two figures in the recurring period, viz. to 8. 0043648, (see the Table at the end of the logarithmic Sines and Tangents) and I subtract 10 from the index, the remainder 2. 5060675 is the logarithm of 320, 6767 &c. or the finite part taken as an integer with the recurring series adjoining as a decimal. But the given number was 320676, 7 &c. whose decimal comma falls to the right of the last figure of the finite part of 320 by three places of figures: therefore I add 3 to the index, and the true logarithm of 320676, 7 &c. will be 5. 5060675; or the index is determined at once to be 5, as being one less than the number of figures contained in the integer 320676, which is part of the given number.

PROBLEM II.

To find the Natural Number that answers to any given Logarithm.

NEGLECT the consideration of the index in the first instance, and find the natural number as an integer answering to the decimal part of the logarithm sought for in the table: then divide the number so found properly by the decimal point or comma, that the first or highest figure may be at the distance from the place of units which is shewn by the index, and to the left if the index be positive, and to the right if the index be negative, adding cyphers to the right or prefixing them to the left, if necessary.

CASE I. If the natural number be wanted true only to three places of figures, look in the first or particular table contained in the two first pages, and in the column marked Logar, for the nearest logarithm over or under to that given: even with this in the preceding column marked N you will find the natural number required. *Example:* The natural number to three places of figures, answering to the logarithm 1. 94117836 will be found immediately, without regarding the index, to be 873, but on account of the index 1 it must be taken 87, 3. Had the index been 3, it must be taken 8730; with the index 2, it must be 873; with the index 0, it must be 8, 73; with the index — 1, it must be 0, 873; with the index — 2, it must be 0, 0873.

CASE

CASE II. If the natural number be wanted true only to four places of figures, seek in the column intitled 0 of the general Table for the logarithm nearest to the given logarithm over or under; in the first column adjoining, intitled N, you will have the four figures of the natural number required, which you must divide properly, according to the index, into integers and decimals. *Example:* The natural number to four places of figures, answering to the logarithm 2.3194713, found immediately, is 2088; but, paying due regard to the index 2, is 208, 8.

CASE III. If the natural number be wanted true only to five places of figures, seek in the general Table for the logarithm nearest to the given logarithm over or under; even with this in the first column, intitled N, you will find the four first figures of the number; and at the top of the column where the logarithm was found you will find the fifth or last figure of the number. *Example:* The natural number to five places of figures answering to the logarithm --- 2.8712012 is 0,074336. The natural number answering to the logarithm 2.8170183 is 656,17, the four last figures of the logarithm being found in the line above that where the three first figures 817 are found, because the four last figures are less than those in the column intitled 0 in the same line.

CASE. IV. If the natural number be wanted true to six, seven, or eight places of figures, seek in the general Table for the next less logarithm than that given, and you will have the first four figures of the natural number even in the same line in the first column, intitled N, and the fifth figure at the top or bottom of the column where the logarithm was found nearly. To find the following figure or figures of the natural number, subtract the logarithm found in the table from the logarithm given, and seek the remainder in the right hand column of the proper table of proportional parts, or the next less number, if it be not found exactly, the corresponding number in the left hand column will be the sixth figure of the natural number.

If more places of figures be required, from the remainder above mentioned subtract the next less number, in the right hand column of the table of proportional parts, for a second remainder, to which affix 0, and seek for it in the right hand column of proportional parts, or the next less number, if it be not found exactly; the corresponding number in the left hand column will be the seventh figure of the natural number. In like manner an eighth figure may be found, if necessary; that is, if such exactness be requisite, and the last remainder was not found exactly in the table of proportional parts. Otherwise, and rather more exactly, especially if eight places of figures are wanted, in order to find the figures additional to the first five, add as many cyphers to the first remainder above-mentioned as you want additional figures, and divide the sum by the difference of the two successive logarithms in the table, the quotient will be the figures required to be added to the five figures of the natural number found before. *Example:* What is the natural number whose logarithm is 5.4414728? The next less logarithmic decimal in the table is 4414595 answering to the natural number 27635; subtract this logarithmic decimal from that given, the remainder is 133: subtract also the given logarithm from the next following it in the table, the difference is 157. In the column of proportional parts, on the side, intitled 157, seek the next less number to 133 which is 126, to which the number

answering

anſwering in the left column is 8, the ſixth figure of the natural number. From the remainder 133 ſubtract the number 126, found in the table, for a ſecond remainder, which is 7, but with o affixed to it is 70; the neareſt number to this in the table of proportional parts is 63, to which the number anſwering in the left column is 4, the ſeventh figure of the natural number. Subtract 63, the number found in the table, from 70, for a third remainder, which is 7, but with o affixed to it is 70, the neareſt number to which in the table of proportional parts is 63; the number anſwering to this in the left column is 4, the eighth figure of the natural number; therefore the firſt five figures of the natural number being 27635, and the ſixth, ſeventh, and eighth figures being 8, 4, 4, the natural number is 27635844. Otherwiſe, add three cyphers to 133, the difference of the given logarithm and the next leſs logarithm in the table, and divide the reſulting number 133000 by 157, the difference of the two ſucceſſive logarithms in the table, the quotient is 847 for the three figures to be added to 27635; therefore the natural number is 27635847; but becauſe the index of the given logarithm is 5 it will be 276358,47, and more exact than that found by the table of proportional parts, from which however it differs only by 3 in exceſs. It is however to be obſerved that the natural number cannot be obtained entirely accurate to eight places of figures, becauſe the logarithms in the table are carried only to 7 places of figures.

CASE V. If the given logarithm is entirely negative, ſeek for it in the tables, as if it was poſitive, and make its correſponding number the denominator of a fraction whoſe numerator is unity. Thus if the logarithm was $-4.37242 = \log. 8'',75 - \log. 206264'',8$, and wholly negative, the natural number will be $\frac{1}{23573}$, which expreſſes the ratio of the ſemidiameter of the earth to its mean diſtance from the ſun.

CASE VI. If the logarithm has a negative characteriſtic, the decimal part being poſitive, find the correſpondent number as uſual, and place its firſt ſignificant figure as many places below the place of units as is expreſſed by its negative index. Thus the logarithm -5.62758, or rather 5.62758, borrowing 10 to the index to put it in a form entirely poſitive, or the logarithmic ſine of $8'',75$, the ſun's mean horizontal parallax, has the natural number 42421 anſwering to it; but becauſe the index is either -5 or 5 with 10 borrowed, the natural number will be 0,000042421, which is to unity, as the ſemidiameter of the earth, to the mean diſtance of the ſun.

THE

THE EXPLANATION AND USE OF THE TABLE OF LOGARITHMIC SINES AND TANGENTS *TO EVERY SECOND OF THE QUADRANT.*

ALTHOUGH the tables are intitled Sines and Tangents, &c. yet artificial or logarithmic ſines and tangents, &c. are to be underſtood. The logarithmic ſines and tangents of arcs, and the logarithmic ſines and tangents of their complements, called logarithmic co-ſines and co-tangents, being often wanted in the ſame calculation, it has long been the practice to place them altogether in the ſame page, or at leaſt at the ſame opening of the book. The ſame method has been uſed in the arrangement of theſe tables. The degrees are put at the top and bottom of the page, and the minutes at the head and foot of the ſeveral columns; except the firſt and laſt, in which the ſeconds are placed. The left hand page contains the logarithmic ſines and co-ſines, and the right hand page contains the logarithmic tangents and co-tangents, as expreſſed by the titles put at the top and bottom of the four departments or particular tables of ſines, co-ſines, tangents and co-tangents. The degrees placed at the top of the page, with the minutes placed at the top of the column, and the ſeconds in the left hand margin, expreſs the arc whoſe L. ſine or tangent, &c. is contained in the correſpondent part of the area of the table under the title ſine, tangent, &c. and the degrees placed at the bottom of the page, with the minutes at the bottom of the column, and the ſeconds in the right hand margin, expreſs the arc whoſe ſine or tangent, &c. is contained in the correſpondent part of the area of the table above the title ſines, tangents, &c. The degrees, minutes, and ſeconds, read off by entering the table at top and bottom, are complements of one another; thoſe read off from the top being leſs than 45°, and thoſe read off from the bottom being greater than 45°.

In order to reduce the table into moderate bounds, it was thought neceſſary to place at the head of each column, and immediately under the title of minutes, the index, or the index and one, two, or three firſt decimal figures of the logarithm, which were common to the whole or at leaſt part of the column, and to put the remaining figures in the area of the table beneath; by which contrivance the ſize of the table has been reduced to near half what it would have been if the logarithms had been printed at full length. It muſt however be carefully obſerved, that the initial figures at the top of the column are common to the whole column, only when the initial figures in the next column to the right continue the ſame; but if they vary from the former by a unit, then the initial figures at the top of the

firſt

firſt column are common only to ſo much of the column as reaches from the top to the place where the numbers in the column, after increaſing up to 99, &c. decreaſe immediately to 00, &c. or, *vice versâ*, after decreaſing to 00 immediately increaſe to 99, &c. and, below this place, the initial figures common to the reſt of the column are thoſe which ſtand at the head of the next column to the right. The table has been ſo arranged that there ſhall never occur more than one ſuch change in any column, except in the column of ſines intitled 7° 4′ where two ſuch changes are found. A ſtrong full-point, of the ſize of thoſe printed at the end of the title Deg. at the top and bottom of every page, may be added to their books, by the curious, at the place where the change occurs, or over the index preceding the initial decimals at the top of the ſame column, or in both places, either with a pen or a printer's type and ink, which will facilitate the uſe of the table; but without that, by only taking a little care, the logarithm may be readily taken out without any danger of miſtake.

PROBLEM I.

To find the logarithmic Sine, Co-Sine, Tangent, or Co-Tangent, of any given Arc.

IF the given arc be under 45°, enter the table, with the degree at top of the page, in the department intitled ſine, co-ſine, tangent, or co-tangent, which ever you want, and with the minute at the head of one of the columns, and with the ſeconds in the left hand margin: even with the ſeconds, under the given minute, you will find the four or more laſt figures of the logarithmic ſine, co-ſine, tangent, or co-tangent, under its reſpective title. But if the given arc be greater than 45°, enter the table with the degree at the bottom of the page, in the proper department of ſine, co-ſine, tangent, or co-tangent, and with the minute at the bottom of one of the columns, and with the ſeconds in the right hand margin; even with the ſeconds, over the given minute, you will find the four or more laſt figures of the logarithmic ſine, tangent, co-ſine, or co-tangent, above its reſpective title. In either caſe you will find the index, or index with initial figures of the decimal, at the top of the column of minutes; except the initial figures vary by unity at the head of the next column to the right, and at the ſame time the number found in the area of the table falls below the place where the numbers of the column, after increaſing to 99, &c. decreaſe immediately to 00; or, *vice versâ*, after decreaſing to 00, &c. immediately increaſe to 99, &c. and then you are to take the index, or index and initial decimals, from the head of the next column to the right. Prefix the initial figures thus found to thoſe taken out of the area of the table, and the logarithmic ſine, co-ſine, tangent, or co-tangent, will be complete.

Otherwiſe; if the numbers of the column of given minutes do not any where increaſe up to 99, &c. and decreaſe immediately to 00, &c. or do not any where decreaſe to 00, &c. and increaſe immediately to 99, &c. or if the given ſeconds indicate the laſt figures of the decimal as lying above ſuch place of change, take and prefix the initial figures from the top of the column: but if the given ſeconds indicate the laſt figures of the decimal as lying below ſuch place of change, take and prefix the initial figures from the head

of

of the next column to the right, which in ſuch caſe will always differ by unity from thoſe at the head of the given column of minutes.

Example 1. The logarithmic ſine of 22° 35′ 25″ is 9.5844880, the four firſt figures of which are taken from the head of the column intitled 35′, and the four laſt in the ſame column in the area of the table even with 25″. *Example* 2. The logarithmic ſine of 22° 37′ 4″ is 9.5849887, the four firſt figures of which are taken from the head of the column intitled 37′, and the four laſt in the ſame column in the area of the table even with 4″. Here the initial figures change by unity, viz. from 9.584 in this column to 9.585 in the next column to the right; but the line of 4″ being above the place where the change of the numbers happens from increaſing to decreaſing, the initial figures are ſtill to be taken from the column of given minutes. *Example* 3. The logarithmic ſine of 22° 37′ 12″ is 9.5850291, whereof the four laſt figures are taken from the area of the table in the column intitled 37′ and even with 12″; but becauſe the initial figures vary by unity from 9.584 in this column to 9.585 in the next to the right, and at the ſame time the line of 12″ falls below the place where the change of the numbers in the column happens from increaſing to decreaſing, the initial figures 9.585 are taken from the head of the next column to the right, viz. that of 38′. *Example* 4. The logarithmic co-ſine of 32° 55′ 10″ is 9.9239873. *Example* 5. The logarithmic ſine of 67° 39′ 40″ is 9.9661192. *Example* 6. The logarithmic ſine of 67° 37′ 30″ is 9.9660066. *Example* 7. The logarithmic ſine of 67° 37′ 20″ is 9.9659979. *Example* 8. The logarithmic co-tangent of 53° 23′ 20″ is 9.8709692. *Example* 9. The logarithmic co-tangent of 53° 23′ 10″ is 9.8710132.

If the given arc has decimals of a ſecond, or a vulgar fraction of a ſecond annexed to it, and the utmoſt exactneſs be required in the calculation, take the difference of the logarithms of the next leſs and next greater arcs, and multiply it by the vulgar or decimal fraction; the product added to the logarithmic ſine or tangent or co-ar. of co-ſine, or ſubtracted from the logarithmic co-ſine, co-tangent, or co-ar. of ſine of the next leſs arc, will give the logarithmic ſine, tangent, co-ar. of co-ſine, co-ſine, co-tangent, or co-ar. of ſine, of the given arc. *Example* 1. The logarithmic ſine of 22° 35′ 25″,47 is $9.5844880 + 51 \times ,47 = 9.5844880 + 24 = 9.5844904$, where 51 is the difference of the logarithmic ſines of 22 35′ 25″, and 22° 35′ 26″ the next leſs and next greater arcs. *Example* 2. The logarithmic co-tangent of 84° 54′ 12″,632 is $8.9503112 - 238 \times ,632 = 8.9503112 - 150 = 8.9502962$, where 238 is the difference of the logarithmic co-tangents of 84° 54′ 12″ and 84° 54′ 13″. *Example* 3. The logarithmic tangent of 3° 28′ 13″ $\frac{43}{117} = 8.7827731 + 349 \times \frac{43}{117} = 8.7827731 + 128 = 8.7827859$. *Example* 4. The co-ar. of log. co-ſine of 41° 7′ 26″,37 is = co-ar. of log. co-ſine of 41° 7′ 26″ +, $37 \times 19 = 0.1230382 + 7 = 0.1230389$. The proportional part of the difference for the fraction of a ſecond may alſo be applied always additively, as well in the caſe of a logarithmic ſine, tangent, or co-ar. of co-ſine, which increaſe with the arcs, as of a logarithmic co-ſine, co-tangent, or co-ar. of ſine, which decreaſe as the arcs increaſe; by adding the product of the difference multiplied by the fraction of a ſecond in the firſt caſe to the log. ſine, tangent, or co-ar. of co-ſine of next leſs arc; and by adding the product of the difference multiplied by the complement

of

of the fraction of a ſecond to unity, in the ſecond caſe, to the log. co-ſine, co-tangent, or co-ar. of ſine of the next greater arc. The firſt or more ſimple caſe has been illuſtrated by ſome of the examples above. The following examples will illuſtrate the latter caſe. *Example* 1. The logarithmic co-tangent of 84° 54′ 12″,632 is = log. co-tangent of 84° 54′ 13″ + 238 × $\overline{1 - ,632}$ = 8.9502874 + 238 × ,368 = 8.9502874 + 88 = 8.9502962 the ſame as found above by the other or common method. *Example* 2. The co-ar. of log. ſine of 32° 49′ 4″,57 is = co-ar. log. ſine 32° 49′ 5″ +,43 × 33 = 0.2660223 + 14 = 0.2660237.

Hitherto the given arc has been ſuppoſed to be leſs than 90°; but if it be greater, and between 90° and 180°, take its ſupplement to 180°; if between 180° and 270°, diminiſh it by 180°; if between 270° and 360°, take its complement to 360°; and take the logarithmic ſines and tangents as before. Otherwiſe, for log. ſine or tangent of an arc between 90° and 180°, or 270° and 360°, take out log. co-ſine or log. co-tangent of exceſs of arc above 90° or 270°; for log. co-ſine or log. co-tangent of an arc above 90° or 270° take out log. ſine or log. tangent of exceſs of arc above 90° or 270°. But for the log. ſine and log. tangent, &c. of an arc between 180° and 270° take the log. ſine and log. tangent, &c. of the exceſs of the arc above 180°. Thus the log. ſine or log. tangent of 120° 27′ 36″ or 300° 27′ 36″ is to be taken as the log. co-ſine or log. co-tangent of 30° 27′ 36″, and the log. co-ſine or log. co-tangent of 120° 27′ 36″ or 300° 27′ 36″ as log. ſine or log. tangent of 30° 27′ 36″, and the log. ſine, co-ſine, tangent, or co-tangent, of 220° 18′ 14″ is to be taken as the log. ſine, co-ſine, tangent, or co-tangent, of 40° 18′ 14″. This method ſaves the trouble of taking the complement of the arc.

If the ſucceſſive differences of the logarithmic ſines and tangents, &c. in the table are irregular, or rather if the ſecond difference exceeds three or four units, the logarithm cannot be had true to the neareſt unit without allowing an equation of ſecond difference, and ſometimes third differences, &c. This happens to the logarithmic ſines and tangents of arcs under 20′, or of co-ſines and co-tangents of arcs above 89° 40′, or within 20′ of 90°. In this caſe, the following rules will determine them accurately and readily without the trouble of equations of differences of various orders. To the logarithm of the arc reduced into ſeconds with the decimal annexed, add the conſtant quantity 4.6855749, and from the ſum ſubtract one-third of the arithmetical complement of the log. co-ſine, the remainder will be the logarithmic ſine of the given arc.

The rule to find the tangent of a ſmall arc is this: To the conſtant logarithm 4.6855749 add the logarithm of the given arc reduced into ſeconds with the decimals annexed, and two-thirds of the arithmetical complement of the log. co-ſine; the ſum is the tangent of the given arc. The ſame ſubtracted from 20 will give the co-tangent of the ſame arc, or the tangent of an arc greater than 89° 40′.

The tangent of ſuch an arc greater than 89° 40′ may be alſo found directly, by ſubtracting the ſum of the logarithm of the ſeconds contained in the complement of the arc to 90°, and two thirds of the arithmetical complement of the co-ſine, from the conſtant quantity 15.3144251.

Example 1. The log. ſine of 10′ 12″, 624 or 612″, 624 is = 4. 6855749 + log. of 612, 624 — ⅓ co-ar. of log. co-ſine 10′ 12″ = 4. 6855749 + 2. 7871940 — 6 = 7. 4727683. *Example* 2. The log. tangent of the ſame arc is 4. 6855749 + 2. 7871940 + 13 = 7. 4727702. *Example* 3. The log. co-tangent of the ſame arc is = 20 — 7. 4727702 = 12. 5272298. Otherwiſe the log. tangent of 89° 49′ 47″, 376 which wants 10′ 12″, 624 of 90° is = 15. 3144251 — log. 612, 624 — ⅔ co-ar. co-ſine 10′ 13″ = 15. 3144251 — 2. 7871940 — 6 = 12. 5272305, the ſame as by the other method.

For greater exactneſs regard may be had to the eighth decimal figure of the logarithm of the ſeconds in the arc, in finding the proportional part, and alſo in finding one third or two thirds of the arithmetical complement of the log. co-ſine, and then the conſtant logarithm to eight places to be uſed will be 4. 68557487, which is the arithmetical complement of the logarithm of 206264, 806 the number of ſeconds in an arc equal to the radius of a circle; finally reject the eighth decimal figure, only if it exceeds five, increaſe the ſeventh decimal figure by unity. *Example:* The log. ſine of 8′ 17″, 426 or 497″, 42 is = 4. 68557487 + 2. 69672848 — 43 = 7. 38230292, or rejecting the laſt figure = 7. 3823029. Theſe rules for computing the ſines and tangents of ſmall arcs extend to 2° without producing an error of more than ⅐ of a unit in the ſeventh place, and to 2°½ without producing an error of more than ⅓ of a unit, at 4° the error is only 2, 3 and is always in defect, and for all leſs arcs ſenſibly proportional to the fourth power of the arc or even its ſine.

Although theſe tables exhibit only the logarithms of the ſines, co-ſines, tangents, and co-tangents, yet we may by them find the logarithms of the ſecants, co-ſecants, verſed-ſines, and co-verſed-ſines.

To the complement arithmetical of the log. co-ſine or ſine add 10. 0000000, and you will have the log. ſecant or co-ſecant. To double the log. ſine of half the arc add 0. 3010300 and reject 10. 0000000 from the ſum, and you will have the logarithm of the verſed-ſine. To double the log. ſine of half the complement of the arc add 0. 3010300, reject 10. 0000000 from the ſum, and you will have the logarithm of the co-verſed-ſine.

PROBLEM II.

To find the Arc anſwering to a given logarithmic Sine, Co-Sine, Tangent, or Co-Tangent.

IF a logarithmic ſine or co-ſine be given, enter the table on the left hand page; but if a logarithmic tangent or co-tangent be given, enter the table on the right hand page; ſeek in ſome column, having the given index, or index and initial figures at top, the remaining figures, but above the place of ſudden change of the ſeries of numbers as to increaſe or decreaſe, if ſuch change occurs; and if you cannot find them ſo circumſtanced, go to the next column to the left, where the initial figures at top vary by unity, and you will find them below the place of change in that column. Then if the title of ſine, co-ſine, &c. which

which ever be concerned, ſtands at the top of the page, the degrees will be alſo found at the top of the page, the minutes at the top of the column where the final figures were found, and the ſeconds even with the final figures in the left hand margin; but if the title of ſine, co-ſine, &c. ſtands at the bottom of the page, the degree will alſo be found at the bottom of the page, the minutes at the bottom of the column in which the final figures were found, and the ſeconds even with the final figures in the right hand margin.

Otherwiſe ſeek for the final figures between the two places in the area of the table where the changes happen in two diſtinct columns, one being immediately to the left of the firſt column which has the given initial figures at its head, the other being the laſt to the right which has the given initial figures at its head. *Example* 1. The arc is required whoſe log. ſine is 9.5844880. I enter the table on the left hand page, and find the initial figures 9.584 at top of the ſeveral columns and the remaining figures, 4880 underneath in one of theſe columns; and, becauſe a log. ſine was given, and the title ſine ſtands at the top of this department which contains the given logarithm, I write out 22 degrees from the top of the department, 35′ from the head of the column where the final figures were found, and 25″ from the left hand margin even with the final figures. Therefore 22° 35′ 25″ is the arc required. There was no change of the initial figures in the columns of minutes in this example, as there was no change of them from this column to the next to the right. *Example* 2. The arc is required whoſe log. ſine is 9.5849887? I find, on the left hand page, in a column having the initial figures 9.584 at top, the remaining figures 9887 beneath, but above the place of ſudden change of the ſeries of numbers as to increaſing or decreaſing. And as a log. ſine was given, and the title ſine ſtands at the top of the page, I take 22° from the top of the page, 37′ from the top of the column where the final figures were found and 4″ from the left hand margin ſtanding even with the final figures. Therefore 22° 37′ 4″ is the arc required. *Example* 3. The arc is required whoſe log. ſine is 9.5850291? I ſeek on the left hand page in the columns having the initial figures 9.585 at top for the final figures 0291 but cannot find them, except in the laſt column to the right hand ſo intitled, and there below the place of change; therefore I go to the firſt column to the left of all theſe having 9.585 at their head till I come to that which varies from them by unity and intitled 9.584, and here I find the given final figures 0291, but below the place of change, as it ought to be. And, becauſe the title ſine is found at top, I take out 22° from the top, 37′ from the head of the column where the final figures were found, and 12″ from the left hand margin even with the final figures. Therefore 22° 37′ 12″ is the arc required. *Example* 4. What is the arc whoſe log. co-ſine is 9.9239873? Seeking in the columns belonging to the ſines and co-ſines under the head 9.923 I can no where find the final figures 9873 except in one column below the place of change; therefore I go to the firſt column to the left, whoſe initial figures vary from theſe by unity, that is to ſay, whoſe initial figures are 9.924, and I find the given final figures 9873 below the place of change, as it ought to be. And becauſe a log. co-ſine was given, and the title co-ſine ſtands at the top of this department, I take out the degree from the top, viz. 32°, and 55′ from the head of the column in which the final figures were found, and 10″ from the left hand margin even with the final figures. Therefore the arc required is 32° 55′ 10″.

Example

Example 5. What is the arc whoſe log. ſine is 9.9661192? I find, on the left hand page, in the column having 9.966 at the head, the final figures 1192 beneath. And as the title ſine ſtands at the bottom of the department, I take out 67° at bottom, 39′ from the bottom of the column containing the final figures, and 40″ from the right hand margin even with the final figures. Therefore the arc required is 67° 39′ 40″. *Example* 6. What is the arc whoſe log. ſine is 9.9660066? I find on the left hand page, in one of the columns having 9.966 at top, the remaining figures 0066 beneath, but above the place of change; therefore the arc required is 67°, ſtanding at the bottom by the ſide of the title ſine, with 37′ ſtanding at the bottom of the column containing the final figures, and 30″ ſtanding in the right hand margin even with the final figures. *Example* 7. What is the arc whoſe log. ſine is 9.9659979? I cannot find on the left hand page the final figures 9979 in any column having 9.965 at the head, and above the place of change; therefore I go to the firſt column to the left hand of theſe whoſe initial figures at top vary from theſe by unity, viz. to that intitled 9.966 in which I find the final figures 9979 below the place of change, as it ought to be; and, as the title ſine ſtands at the bottom of the page, I look there for the degree 67°, and alſo for 37′ at the bottom of the column containing the final figures, and 20″ in the right hand margin even with the final figures. Therefore the arc required is 67° 37′ 20″. *Example* 8. What is the arc whoſe log. co-tangent is 9.8709692? I find on the right hand page in a column having 9.870 at the head, the remaining figures 9692, which are above the place of change; and as the title co-tangent ſtands at the bottom of the page, I take out the degree at the bottom by the ſide of the title, viz. 53°; the minutes at the bottom of the column containing the final figures, viz. 23′; and the ſeconds in the right hand margin even with the final figures, viz. 20″. *Example* 9. What is the arc whoſe logarithmic co-tangent is 9.8710132? I ſeek in the right hand page in the columns having 9.871 at the head for the remaining figures 0132, but cannot find them except in one column below the place of change; therefore I go to the firſt column to the left whoſe initial figures vary from theſe by unity, viz. 9.870 and there I find the given final figures 0132, below the place of change as it ought to be. And as the title co-tangent ſtands at the bottom of the page, I take out 53° at the bottom by the ſide of the title, and 23′ from the bottom of the column of the final figures, and 10″ from the right hand margin even with the final figures.

If the given logarithm is not to be found in the table, make uſe of that which approaches neareſt to it over or under, and find its correſpondent arc, which will be the required arc true to half a ſecond. But if you want the arc more accurately, or as accurately as the tables are capable of giving it, take the difference of the given logarithm and the next leſs of the ſame kind in the table, if the given logarithm be a ſine or tangent; or take the difference of the given logarithm and the next greater of the ſame kind in the table, if the given logarithm be a co-ſine or co-tangent; that is, take the difference between the given logarithm and that logarithm of the two of the ſame kind in the table, one greater and the other leſs than the given logarithm, which lies neareſt to the given title of ſine, or co-ſine, &c. at the top or bottom of the page, for the numerator of a fraction; and take the difference of the two logarithms in the table, one of which is next leſs and the other next greater than the given logarithm for the denominator

nator of the fraction; and you will have the fraction of a ſecond to be added to the arc anſwering to that logarithm of the two in the table, one leſs and the other greater than the given logarithm, which is neareſt to the given title. This vulgar fraction of a ſecond may be converted into a decimal, if required, by dividing the numerator by the denominator. *Example* 1. What is the arc whoſe logarithmic ſine is 9. 5844896? I look among the ſines and find 9. 5844880 the next leſs, and 9. 5844931 the next greater ſine in the table; I take the difference between 9. 5844880 which lies neareſt to the title of ſine at the top of the page, and 9. 5844896 the given logarithm, which is 16, for the numerator of the fraction. I alſo take the difference of the two logarithms in the table, which is 51, for the denominator of the fraction. The arc anſwering to the log. ſine 9. 5844880, that neareſt to the title, is 22° 35′ 25″: therefore the arc required is 22° 35′ 25″ $\frac{16}{51}$ = 22° 35′ 25″, 313, &c. *Example* 2. What is the arc whoſe log. co-tangent is 9. 8710096? I look among the co-tangents and find the next greater and next leſs co-tangents to be 9. 8710132 and 9. 8710088. I take the difference between the firſt 9. 8710132, which lies neareſt to the title co-tangent and 9. 8710096 the given co-tangent, which is 36 for the numerator of a fraction. I alſo take the difference of the two logarithms in the table, which is 44 for the denominator of the fraction. Therefore the fraction is $\frac{36}{44}$, and as the arc anſwering to the log. co-tangent 9. 8710132, which is neareſt to the title, is 53° 23′ 10″, the arc required is 53° 23′ 10″ $\frac{36}{44}$ = 53° 23′ 10″ $\frac{9}{11}$ = 53° 23′ 10″, 818, &c.

Hitherto the required arc has been ſuppoſed to be under 90°; but if it ſhould be greater, find the arc as before, viz. leſs than 90°; and if the required arc ſhould be between 90° and 180°, take the ſupplement of the arc found to 180°; if between 180° and 270° take the ſum of 180° and the arc found; if between 270° and 360° take the complement of the arc found to 360°, and you will have the required arc. Otherwiſe, if the required arc ſhould be between 90° and 180°, or between 270° and 360°, to avoid the trouble of taking the ſupplement of the reſult to 180°, or the complement of the reſult to 360°, conſider the log. ſine or tangent of an arc as the log. co-ſine or log co-tangent of another arc; and conſider the log. co-ſine or log. co-tangent of an arc as the log. ſine or log. tangent of another arc, which being found in the tables accordingly, and added to 90° or 270°, will give the arc required. Thus an arc between 180° and 270° is = 180° + arc found anſwering to a given log. ſine, co-ſine, tangent, or co-tangent: and an arc between 90° and 180°, or 270° and 360° = 90° or 270° + arc whoſe log. co-ſine = given log. ſine; or whoſe log. ſine = given log. co-ſine, or whoſe log. co-tangent = given log. tangent, or whoſe log. tangent = given log. co-tangent.

If the ſucceſſive differences of the logarithmic ſines and tangents, &c. in the table are irregular, or rather if the ſecond difference exceeds three or four units, the arc cannot be had true to the utmoſt accuracy as to the fractional part of a ſecond by the uſual method, unleſs an allowance be made on account of thoſe differences, and perhaps alſo of third and fourth differences, &c. This happens when the log. ſine, tangent, or co-tangent of an arc under 20′, or the log. co-ſine, tangent, or co-tangent of an arc above 89° 40′, or within 20′ of 90° are given.

In theſe caſes the following rules will determine the arc accurately and readily, without the trouble of computing the effect ariſing from the differences of various orders. The rule to find the arc from the ſine

is this: To the given logarithmic ſine of a ſmall arc add the conſtant logarithm 5. 3144251, and $\frac{1}{3}$ of co-ar. of log. co-ſine; and ſubtract 10 from the index of the ſum, and you will have the logarithm of the number of ſeconds with the decimal fraction of the given arc. The rule to find the arc from the tangent is this: To the log. tangent of a ſmall arc add the conſtant logarithm 5. 3144251, and from the ſum ſubtract $\frac{2}{3}$ of co-ar of log. co-ſine, and ſubtract 10 from the index, and you will have the logarithm of the number of ſeconds with the decimal fraction of the given arc. If the co-tangent of an arc under 20′, or tangent of an arc above 89° 40′ were given, take the complement of the co-tangent of the ſmall arc or of the tangent of the large arc to 20. 00, &c. and you will have the tangent of a ſmall arc under 20′; from which find the arc as before, which will be that whoſe co-tangent was given; or its complement to 90° will be that whoſe tangent was given. The log. co-ſine of an arc above 89° 40′ being = log. ſine of an arc under 20′, conſider it as a log. ſine, and find the arc by the rule given above; its complement to 90 will be the arc required. The log. co-tangent of an arc above 89° 40′ being = log. tangent of an arc under 20′, find this ſmall arc by the rule above: its complement to 90° will be the arc required. *Example* 1. What is the arc whoſe log. ſine is = 7. 4727683? Anſwer: 7. 4727683 + 5. 3144251 + 0. 0000006 — 10, 00, &c. = 2. 7871940 the logarithm of the required arc, which is therefore = 612″, 624 = 10′ 12″, 624. *Example* 2. What is the arc whoſe log. tangent is 7. 5228031? Anſwer 7. 5228031 + 5. 3144251 — 0. 0000016 — 10. 00, &c. = 2. 8372266, the logarithm of the required arc; which is therefore = 687″, 427 = 11′ 27″, 427. *Example* 3. What is the arc, greater than 89° 40′, whoſe log. co-ſine is 7. 4727683? This logarithm will be the ſine of a ſmall arc under 20′, which has been found in example 1 = 10′ 12″, 624. Therefore its complement or 89° 49′ 47″, 376 is the arc required. *Example* 4. What is the arc, leſs than 20′, whoſe log. co-tangent = 12. 4771969? Anſwer: The complement of 12. 4771969 to 20. 00, &c. = 7. 5228031 is the tangent of a ſmall arc under 20′, which has been found in example 2. = 11′ 27″, 427. *Example* 5. What is the arc greater than 89° 40′ whoſe tangent = 12. 4771969. Anſwer: The complement of 12. 4771969 to 20. 00, &c. = 7. 5228031 the tangent of an arc under 20′, which has been found in example 2. = 11′ 27″, 427; its complement to 90 = 89° 48′ 32″, 573 is the arc required. *Example* 6. What is the arc, greater than 89° 40′, whoſe log. co-tangent = 7. 5228031. Anſwer: 7. 5228031 is the tangent of an arc under 20′, which has been found in example 2. = 11′ 27″, 427; its complement to 90° = 89° 48′ 32″, 573 is the arc required.

If the logarithmic ſecant or co-ſecant were given, to find the arc by theſe tables; ſubtract 10 from the index, the complement of the remainder is the log. co-ſine or ſine of the arc. If the logarithmic verſed-ſine or co-verſed-ſine were given to find the arc; add 9. 6989700 to the log. verſed-ſine, half the ſum will be the log. ſine of half the arc. Add 9. 6989700 to the log. co-verſed-ſine, half the ſum will be the log. ſine of half the complement of the arc.

It may be proper to remark here that the radius of the quadrant is unity, and the ſines, co-ſines, tangents, &c. are reckoned in decimal parts of the ſame. The ſines and co-ſines are leſs than the radius, and ſo are the tangents of arcs under 45°; their numerical values are then fractions, properly ſpeaking, and the

characteriſtics

characteriſtics of their logarithms ſhould be negative; and the logarithm of the radius ſhould be nothing. But the tangents of arcs greater than 45°, and the ſecants and co-ſecants are greater than the radius, and conſequently their logarithms are affirmative. To put the logarithms in the table under a form wholly poſitive, 10 has been borrowed or added to all the characteriſtics, and the logarithm of the radius has been made 10. But we muſt remember at the end of any addition, to repay the ten or tens borrowed in the place of the index, by ſubtracting as many tens from the index of the reſult as there were logarithms of ſines, co-ſines, &c. which entered into the calculation, if the reſult be the logarithm of a number; and if ſo many tens cannot be ſubtracted, to ſubtract a number of tens leſs by one than the number of the log. ſines, &c. which entered the calculation, and the reſult will be the logarithm of a decimal fraction: but if the reſult be a log. ſine, co-ſine, tangent, &c. the number of tens ſubtracted from the index muſt be leſs by one than the number of log. ſines, co-ſines, &c. which entered the calculation; except, however, that no diminution is to be made to the index, on account of the arithmetical complement of a log. ſine or log. co-ſine, that may enter the calculation, which is a proper and affirmative logarithm.

Of the ADDITION of LOGARITHMS.

1. IF the logarithms are all affirmative, or all negative, add them together in the ſame manner as other decimal numbers, and prefix the common ſign to the ſum. Thus ± 2.4771213; ± 1.7781513; $\pm 4.0791812 = \pm 8.3344538$.

2. If the logarithms are ſome affirmative and ſome negative, take the difference between the ſums of the affirmative and negative, and prefix the ſign of the greater. Thus $+ 3.6989700$; $- 7.6532125$; $+ 2.4771213$; $- 4.5686362 = - 12.2218487 + 6.1760913 = 6.0457574$.

3. If the indices only of the logarithms are all negative: add the affirmative parts of the logarithms together; the ſum of the indices, diminiſhed by what is carried from the affirmative parts, if any, will be a negative index. Thus $\bar{1}.6989700$; $\bar{2}.9542425$; $\bar{4}.8239087 = \bar{5}.4771212$.

4. If the indices have different ſigns, the decimal parts being all affirmative: add the affirmative parts of the logarithms together, and what is carried (if any) add to the affirmative indices; then the difference of the affirmative and negative indices, with the ſign of the greater, will be the index of the ſum of the logarithms. Thus the ſum of 3.6989700; $\bar{7}.3467875$; 1.4771213; $\bar{5}.4313638 = \bar{7}.9542426$.

5. If ſome of the logarithms are negative, or ſome have the index only negative, the ſum of the logarithms may be alſo found thus: ſubſtitute for the negative logarithm its arithmetical complement; or for the negative index, where that only is negative, ſubſtitute its arithmetical complement; and add the logarithms thus transformed to the affirmative logarithms, and from the ſum ſubtract as many tens in the place of the index, as arithmetical complements were taken, if poſſible, and you will have the proper logarithmic ſum; but if the index of the ſum immediately found be leſs than ſo many tens as have been

directed

directed to be ſubtracted, ſubtract one ten leſs, that is ſubtract ſo many tens as arithmetical complements were taken, wanting one; the remainder will be the logarithm of the ſum, which will be a decimal fraction, whoſe firſt ſignificant figure will be ſo many places to the right of unity as the index wants of 10. Thus the ſum of 3.6989700; $\overline{7}.3467875$; 1.4771213; -4.5686362; $= 3.6989700 + 3.3467875 + 1.4771213 + 5.4313638 - 20 = 13.9542426 - 20$; or becauſe 20 the index to be ſubtracted is greater than 13 the index of the ſum, ſubtract 10 leſs, and the ſum will be 3.9542426, the logarithm of the decimal fraction ,000000900000 2, whoſe firſt ſignificant figure lies $10 - 3 =$ ſeven places of figures to the right of, or below, the place of units.

SUBTRACTION of LOGARITHMS.

1. WHEN the logarithms are both affirmative, or both negative, or the one affirmative and the other negative, change the ſign of the ſubtrahend, then proceed as in addition.

2. When only the indices are both or either of them negative, ſubtract the affirmative part of the ſubtrahend from that of the minuend, as uſual; and if one is borrowed from the index place add + 1 to the index of the ſubtrahend, then change its ſign, and do as in addition.

Thus $\overline{3}.1549020$ ſubtracted from $\overline{7}.9788107$ leaves the remainder $\overline{4}.8239087$; $\overline{3}.6989700$ ſubtracted from $\overline{4}.6532125$ leaves $\overline{2}.9542425$; 4.6989700 ſubtracted from $\overline{2}.2218487$ leaves $\overline{7}.5228787$; $\overline{4}.9542425$ ſubtracted from 6.6532125 leaves 9.6989700.

3. Otherwiſe, make uſe of this one rule comprehending both caſes. If the minuend and ſubtrahend are both affirmative logarithms, take the latter from the former, borrowing 10, if neceſſary; remembering, that if 10 was borrowed the remainder will be the logarithm of a decimal fraction. But if one or both logarithms are negative, or have the index only negative, ſubſtitute for the negative logarithm its arithmetical complement; or for the negative index, if that only was negative, ſubſtitute its arithmetical complement; and further, if the index of one of the logarithms was poſitive, increaſe it by 10. Now take the ſubtrahend from the minuend, both being thus altered, borrowing 10, if neceſſary; remembering that if 10 was borrowed, the remainder will be the logarithm of a decimal fraction.

Thus 1.9542425 taken from 5.1303338 leaves 3.1760913. 4.1867431 taken from 2.0643564 leaves 7.8776133 the logarithm of a decimal fraction, becauſe 10 was borrowed to make the ſubtraction. To ſubtract -3.1760913 from -6.0211893, take their arithmetical complements 6.8239087 and 3.9788107, and ſubtract the firſt from the ſecond, the remainder is 7.1549020, the logarithm of a decimal fraction, becauſe 10 was borrowed. To ſubtract -3.1760913 from $\overline{7}.9788107$, take the arithmetical complement of the firſt, and the arithmetical complement of the index of the ſecond, and affix the decimal part of the logarithm to it, and you will have 6.8239087 and 3.9788107, the firſt of which ſubtracted from the ſecond leaves 7.1549020, the logarithm of a decimal fraction, becauſe 10 was borrowed. To

ſubtract

ſubtract $\bar{3}$. 1549020 from $\bar{7}$. 9788107. The arithmetical complements of the indices being taken, and ſubſtituted in their place, give the logarithms 7. 1549020 and 3. 9788107, the firſt of which taken from the ſecond leaves 6. 8239087, the logarithm of a decimal fraction becauſe 10 was borrowed. To ſubtract $\bar{3}$. 0457575 from 0. 5228788; ſubſtitute for the index — 3 its arithmetical complement, and add 10 to the index of the other logarithm, and we ſhall have 7. 0457575 and 10. 5228788, the firſt of which taken from the ſecond leaves 3. 4771213. To ſubtract 4. 6989700 from $\bar{2}$. 2218487; take the arithmetical complement of the negative index, and add 10 to the index of the other logarithm, and we ſhall have 14. 6989700 and 8. 2218487, the firſt of which taken from the ſecond leaves 3. 5228787, the logarithm of a decimal fraction, becauſe 10 was borrowed to make the ſubtraction.

MULTIPLICATION and DIVISION of LOGARITHMS.

1. IF the logarithm, which is to be multiplied or divided, is wholly affirmative or negative, multiply or divide it by the given number, and prefix the ſign of the given logarithm to the product or quotient.

Thus the logarithm + 2. 3010300 multiplied by 4 gives the product = + 9. 2041200. The logarithm — 2. 7781512 multiplied by 3 gives the product — 8. 3344536. The logarithm 9. 2041200 divided by 4 gives the quotient + 2. 3010300. The logarithm — 8. 3344536 divided by 3 gives the quotient — 2. 7781512.

2. If the index of the logarithm, which is to be multiplied, is negative, its decimal part being affirmative, and the multiplicator be a whole number, multiply the decimal part of the logarithm by the multiplicator, and ſubtract what is carried over to the place of units from the product of the negative index by the multiplicator, the remainder will be the negative index of the product, to which affix the decimal part of the product.

To divide a logarithm in the ſame circumſtances, by any whole number, if the negative index contains or meaſures the given number or diviſor an exact number of times, divide the negative index by the given diviſor for a new negative index, and the decimal part of the logarithm by the ſame for a new decimal part. But if the negative index does not meaſure or contain the given diviſor an exact number of times, increaſe the negative index by the leaſt number that will make the index a multiple of the diviſor, and prefix the ſame number to the decimal part of the index, and divide the increaſed index by the diviſor for a new negative index, and the increaſed decimal part by the ſame diviſor for a new decimal part.

Otherwiſe multiply or divide the complement of the given logarithm, which will be affirmative, by the given multiplicator or diviſor; the complement of the product or quotient will be the product or quotient required.

Thus the product of the logarithm $\bar{2}.6989700$ by 5 is $= \bar{7}.4948500$; the quotient of $\bar{9}.9030972$ divided by 3 is $= \bar{3}.3010324$. The quotient of $\bar{5}.7958828$ divided by 4 is $= \bar{2}.9489707$. Or the complement of the same logarithm $\bar{5}.7958828$ is 4.2041172 which divided by 4 gives 1.0510293, whose complement is $\bar{2}.9489707$, the same as found before by the other method.

Otherwise: To multiply the logarithm of a decimal fraction by any whole number, let the logarithm be put under an affirmative form, by adding 10 to the negative index, and multiply it by the given number, and diminish the index by the product of the number lessened by unity multiplied into 10, and you will have the required product under a positive form, with 10 borrowed to the index. And to divide the logarithm of a decimal fraction by a whole number, let the logarithm be put under an affirmative form, by adding the product of 10 by the given divisor, and dividing the sum by the divisor, you will have the required quotient, under a positive form, with 10 borrowed to the index.

Thus to multiply the logarithm $\bar{2}.6989700$ by 5, adding 10 to the negative index, the logarithm becomes 8.6989700, which multiplied by 5 gives 43.4948500, from which subtracting 40 = the product of 10 into 4 (the given multiplicator lessened by unity) leaves 3.4948500, the logarithm required, with 10 borrowed to the index. To divide the logarithm $\bar{7}.4948500$ by 5; adding 50 (the product of 10 by the given divisor 5) to the negative index $\bar{7}$, the logarithm becomes 43.4948500, which divided by 5 gives 8.6989700, the required quotient under a positive form, with 10 borrowed to the index.

3. If the multiplicator of the logarithm is a fraction, either proper or improper $\left(\text{as } \frac{m}{n}\right)$, the index of the logarithm being negative, and the decimal part affirmative, as before; add the denominator (n) or some multiple of it (p n) to the negative index of the logarithm (— r), so as to make the sum (n — r or p n — r) either 0 or a positive number, and affix the decimal part of the logarithm to it, and multiply the whole by the given fraction, and from the index of the product subtract the numerator of the fraction, or the numerator multiplied into the number by which the denominator was multiplied before (m or p m), and you will have the product required. To divide a logarithm by a fraction is the same thing as to multiply it by the reciprocal of that fraction, which is produced by changing the numerator and denominator for one another, and therefore requires no particular directions. *Example* 1. To multiply the logarithm $\bar{1}.9175502$ by $\frac{3}{2}$? The denominator 2 added to the negative index $\bar{1}$ makes the logarithm become 1.9175502, which multiplied by the fraction $\frac{3}{2}$ gives 2.8763253, from which subtracting the numerator 3 the result is $\bar{1}.8763253$, the product required. *Example* 2. To multiply the logarithm $\bar{4}.6346587$ by the fraction $\frac{2}{3}$? Because the denominator 3, taken absolutely, is less than the negative index $\bar{4}$, I multiply the denominator by 2, which makes 6, which I add to the negative index $\bar{4}$, and the logarithm will become 2.6346587, which I multiply by the fraction $\frac{2}{3}$, the product is 1.7564391, from which I subtract 4, the product of the numerator by 2 (because the denominator was multiplied by 2) which leaves $\bar{3}.7564391$, the product required.

Otherwise,

Otherwiſe, to multiply the logarithm of a decimal fraction by any vulgar fraction, proper, or improper; let the logarithm be put under an affirmative form, by adding 10 to the negative index, and multiply it by the numerator of the fraction, and add or ſubtract the product of the difference of the numerator and denominator by 10, according as the fraction is proper or improper, and divide the ſum or difference by the denominator of the fraction, and you will have the logarithm required in an affirmative form, or with 10 borrowed to the index. Thus to find the product of the logarithm $\bar{1}.8763253$ by $\frac{2}{5}$; add 10 to the negative index $\bar{1}$, which puts the logarithm under a form wholly affirmative, and makes it 9.8763253; this multiply by the numerator 2, which gives 19.7526506, to which, becauſe the fraction is proper, add 30 (the product of 3, the difference of the numerator and denominator, by 10), the ſum will be 49.7526506, which divided by the denominator 5 gives the quotient 9.9505301, the logarithm required under a form wholly affirmative, in which 10 is borrowed to the index. Alſo to multiply the logarithm $\bar{1}.9505301$ by $\frac{5}{2}$, which is an improper fraction; add 10 to the negative index $\bar{1}$, makes the logarithm 9.9505301, wholly affirmative; which multiplied by the numerator 5 gives 49.7526505, from which ſubtracting 30 (the product of the difference of the numerator and denominator by 10) becauſe the fraction is improper, leaves 19.7526506, which divided by the denominator 2 gives the quotient 9.8763253, the logarithm required under a poſitive form with 10 borrowed to the index.

Various Rules and Problems, wherein ſome of the Uſes of Logarithms are ſhewn.

The RULE of PROPORTION.

THE anſwer will be obtained by finding a dividend compoſed of factors, which are ſome of the given terms; and a diviſor compoſed of factors, which are the reſt of the given terms. The quotient will be the term required.

Seek among the terms, which enter into the queſtion, that which is of the ſame kind with the unknown term, which call the homologous term. Call thoſe terms which have a relation to the unknown term, its correlatives; and thoſe which have a relation to the homologous term, its correlatives. The dividend will be compoſed of thoſe correlatives of the unknown term, which have a direct ratio to it, that is to ſay, which make the unknown term increaſe or decreaſe, as they increaſe or decreaſe themſelves; of the homologous term; and of thoſe correlatives of the homologous term, which bear an inverſe ratio to the ſame, that is to ſay, which make the homologous term decreaſe or increaſe as they themſelves increaſe or decreaſe. And the diviſor will be compoſed of thoſe correlatives of the unknown term, which bear an inverſe ratio to it; and of thoſe correlatives of the homologous term which bear a direct ratio to it.

This rule is ſo general as to comprehend all caſes that come under the common rules of proportion; whether direct or inverſe; whether ſingle or any how compounded.

Example

Example 1. If 280*l.* ſerve 120 men for 32 weeks, how much will ſerve 360 men for 48 weeks? Anſwer, 1260*l.*

The unknown term, or term ſought, is a ſum of money or a number of pounds. Therefore 280*l.* is the homologous term, whoſe correlatives are 120 men, and 32 weeks; and the correlatives of the unknown term are 360 men, and 48 weeks. Now the correlatives of the unknown term have both a direct ratio to it, for there muſt be ſo many more pounds, as there are more men to be ſupported, and as they are to be ſupported for a longer time. Therefore 360, 48, and 280 will be the factors of the dividend. Alſo the correlatives of the homologous term have both a direct ratio to it; therefore 120, and 32 will be the factors of the diviſor; and the quotient will give the anſwer $= \frac{360 \times 48 \times 280l.}{120 \times 32} = 1260l.$ As will appear by adding together the logarithms of 360, 48, and 280, and the arithmetical complements of the logarithms of 120 and 32, and ſubtracting 20, on account of the two arithmetical complements, from the ſum; which will give 2,5563025 + 1.6812412 + 2.4471580 + 7.9208188 + 8.4948500 — 20 = 3.1003705 = log. of 1260, the number of pounds required.

Example 2. What is the intereſt of 2750*l.* for 292 days at $4\frac{1}{2}$ per cent. per annum?

Anſwer, 99*l.*

If 100*l.* in 365 days bring an intereſt of 4,5*l.* what intereſt will 2750*l.* bring in 292 days? The unknown term is an intereſt, therefore the homologous term is 4,5*l.* whoſe correlatives are 100*l.* and 365 days. The correlatives of the unknown term are 2750*l.* and 292 days, which both bear a direct ratio to it, becauſe the intereſt will be ſo much greater, as the ſum put to intereſt is greater, and as the time for which it is lent is greater. For the ſame reaſon, the correlatives of the homologous term bear a direct ratio to it. Therefore the term required $= \frac{2750 \times 292 \times 4,5l.}{100 \times 365} = 99l.$ By logarithms, 3.43933269 + 2.46538285 + 0.65321251 + 8.00000000 + 7.43770714 — 20 = 1.99563519 = log. of 99, the number of pounds required.

Example 3. If 248 men, in $5\frac{1}{2}$ days, of 11 hours each, dig a trench $232\frac{1}{2}$ yards long, $3\frac{2}{3}$ wide, and $2\frac{1}{3}$ deep, in how many days, of 9 hours, will 24 men dig a trench $337\frac{1}{2}$ yards long, $5\frac{3}{5}$ wide, and $3\frac{1}{2}$ deep? Anſwer, 231 days. The unknown term is a number of days, the homologous term is then $5\frac{1}{2}$ or 5,5 days. The correlatives of the unknown term are 24 men; 9 hours; 337,5 yards; 5,6 yards; and 3,5 yards. The correlatives of 5,5 days, the homologous term, are 248 men; 11 hours; 232,5 yards; 3,666, &c. yards; and 2,333, &c. yards. Of the correlatives of the unknown term, the dimenſions of the ditch bear a direct ratio to it, becauſe the time taken to make the trench will be ſo much greater, as the trench is longer, wider, and deeper: on the other hand the men, and hours bear an inverſe ratio to the unknown term, becauſe the time will be ſo much leſs or greater, as more or fewer men are employed, and theſe men work more hours a day. Therefore 337,5; 5,6; and 3,5 will be factors of the dividend; and 9, and 24 will be factors of the diviſor. Alſo the homologous term 5,5 will, as it always is, be a factor of the dividend. Now its correlatives 248 men, and 11 hours (the length of their day) bear an inverſe ratio to the time taken to make their trench; whilſt the dimenſions of the trench 232,5 yards; 3.666,

3,666, &c. yards; and 2,333, &c. yards bear a direct ratio to it. Therefore 248 and 11 will be factors of the dividend, and 232,5 yards, 3,666, &c. yards, and 2,333, &c. yards will be factors of the divisor. Hence the term required $= \frac{337,5 \times 5,6 \times 3,5 \times 5,5^{d} \times 248 \times 11}{9 \times 24 \times 232,5 \times 3,6 \times 2,3} = 231$ days. By logarithms 2. 5282738 + 0. 7481880 + 0. 5440680 + 0. 7403627 + 2. 3944517 + 1. 0413927 + 9. 0457575 + 8. 6197888 + 7. 6335770 + 9. 4357286 + 9. 6320232 — 50 = 2. 3636120 = log. of 231, the number of days required.

COMPOUND RULE,

OR

RULE for the COMBINATION and ARBITRATION of EXCHANGE.

IF the course of exchange be given between one place and a second, between the second and a third, between the third and a fourth, &c. &c. and money be supposed to be remitted in a circuitous way from the first place to the last; the arbitration of exchange is the method of computing, from these *data*, the rate of exchange from the first place to the last; or of finding, either what quantity of money of the last place will be equivalent to a given sum of the first place; or what quantity of money of the first place will be equivalent to a given sum of the last place.

1. Distinguish the given rates or prices in the circular course, into antecedents and consequents; and place the antecedents in one column, and consequents in another on the right, fronting one another by way of equation. And, in this distribution into antecedents and consequents, each consequent must be of the same kind with the next antecedent, and the first antecedent of the same kind with the last consequent, which must be the sum whose value in exchange is required.

2. Multiply the antecedents continually together for a divisor, and the consequents continually for a dividend; the quotient of the products will be the sum required in exchange.

Example 1. If London would remit 1000l. sterling to Spain, first by way of Holland, thence to France, thence to Venice, and thence to Spain; the exchange from London to Holland being 35s. per l.; thence to France at 58d. per crown; thence to Venice at 100 crowns per 60 ducats; and thence to Spain at 360 maravedies per ducat; how many piastres will it produce in Spain?

Antecedents.		Consequents.
1l. sterling	=	35s. or 420d. Flemish.
58d. Flemish	=	1 crown.
100 crowns	=	60 ducats.
1 ducat	=	360 maravedies.
272 maravedies	=	1 piastre.
How many piastres	=	1000l. sterling.?

Then $\frac{420 \times 60 \times 360 \times 1000}{58 \times 100 \times 272} = 5750,507$ piaſtres.

By logarithms 2.6232493 + 1.7781512 + 2.5563025 + 3.0000000 + 8.2365720 + 8.0000000 + 7.5654311 — 30 = 3.7597061 the log. of 5750,507. Therefore the produce in Spain will be 5750,507 piaſtres.

Example 2. If London would remit by the way of Holland, thence to France, thence to Venice, and thence to Spain, the value of 5000 piaſtres, in Engliſh pounds ſterling, the courſe of exchange being as in example 1. I deſire to know how many pounds ſterling muſt be remitted to pay the 5000 piaſtres?

Antecedents.		Conſequents.
1 piaſtre	=	272 maravedies.
360 maravedies	=	1 ducat Venice.
60 ducats	=	100 crowns French.
1 crown	=	58d.
35s. or 420d.	=	1l. ſterling.

How many pounds ſterling = 5000 piaſtres?

Then $\frac{272 \times 100 \times 58 \times 5000}{360 \times 60 \times 420} = 869,4885$l. ſterling.

By logarithms 2.4345689 + 2.0000000 + 1.7634280 + 3.6989700 + 7.4436975 + 8.2218487 + 7.3767507 — 30 = 2.9392638 5 = log. of 869,4885. Therefore London muſt remit 869,4885l. ſterling.

Of COMPOUND INTEREST.

Let a be an annuity, or ſum which will become due, or be payable repeatedly, at ſeveral equal intervals of time to n number of times. Let the rate of compound intereſt be that of 1 to 1 + r, where r is the gain of 1l. in one time. Let p be the preſent value of the ſaid annuities, or the principal money which would purchaſe them; and m the amount or future value of the ſame annuities at the end of n times, or what they will produce at the end of the n times, if continually put out to compound intereſt as faſt as they become due.

The amount m will be equal to the ſum of the terms of the geometrical progreſſion, $a ; a.\overline{1+r} : a.\overline{1+r}^2 : a.\overline{1+r}^3 \ldots . a.\overline{1+r}^{n-1} = \frac{a.\overline{1+r}^n - 1}{r}$: and the principal p will be equal to the ſum of the terms of this other ſeries, $\frac{a}{1+r} : \frac{a}{\overline{1+r}^2} : \frac{a}{\overline{1+r}^3} \ldots . \frac{a}{\overline{1+r}^n} = \frac{a.\overline{1+r}^n - 1}{r.1+r^n}$: by means of which two equations, any three of theſe five terms a, n, r, m, p being given, the two others are found, as ſhewn in the following table. To facilitate the calculations by the table of logarithmic ſines and tangents; put $r = t^2$, A or

$1+r$

$1+r=\text{sec}^2$, $A=\sqrt[n]{\frac{m}{p}}$. Put alſo $\overline{1+r}^n=\text{sec}^2$, $B=\overline{\text{sec}^2, A}^n=\frac{m}{p}$. $\because \overline{1+r}^n-1=\frac{m}{p}-1=t^2$, B, and $\frac{\overline{1+r}^n-1}{\overline{1+r}^n}=s^2$, B. Put $\frac{pr}{a}=s^2$, C $\because 1-\frac{pr}{a}=c^2$, C. Put $\frac{rm}{a}=t^2$, D $\because 1+\frac{rm}{a}=\text{sec}^2$, D. Put $\frac{a}{m}\times t^2$, $B=t^2$, E $\because 1+\frac{a}{m}\times t^2$, $B=\text{sec}^2$, E

GIVEN	CASE	REQUIRED.	CASE	REQUIRED.
a, p, r	1	$m=\frac{ap}{a-pr}=\frac{p}{c^2, C}$	2	$n=\frac{L.a-L.\overline{a-pr}}{L.\overline{1+r}}=\frac{2\,L.\,\text{sec, C}-20}{L.\,1+r}$
a, m, r	3	$p=\frac{am}{a+rm}=m\times c^2$, D	4	$n=\frac{L.\overline{a+mr}-L.a}{L.\overline{1+r}}=\frac{2\,L.\,\text{sec, D}-20}{L.\overline{1+r}}$

	17 and 18	Given a, n, p, required m and r ? $\frac{a}{p}\times\text{co-t}^2$, $A\times s^2$, $B-1=0$ Aſſume different values of A and thence find the correſponding values of B till the expreſſion is $=0$ Then $m=p\times\text{sec}^2$, B and $1+r=\text{sec}^2$, A	19 and 20	Given a, m, n, required p and r ? $\frac{a}{m}\times\text{co-t}^2$, $A\times t^2$, $B-1=0$ Aſſume different values of A and thence find the correſpondent values of B till the expreſſion is $=0$ Then $p=m\times c^2$, B and $1+r=\text{sec}^2$, A

2. If the annuity commence t times hence; let n = time of continuance. Put $\frac{pr\times\overline{1+r}^t}{a}=s^2$, F. We ſhall have the five following formulæ, by which having given any four of the five quantities a, p, n, r, t, we may find the fifth.

CASE	GIVEN	REQUIRED.
1	a, n, r, t	$p = \frac{a \times \overline{1+r}^{n} - 1}{r \times \overline{1+r}^{n} \times \overline{1+r}^{t}} = \frac{a \times s^2, B}{r \times \overline{1+r}^{t}}$
2	p, n, r, t	$a = \frac{pr \times \overline{1+r}^{n} \times \overline{1+r}^{t}}{\overline{1+r}^{n} - 1} = \frac{pr \times \overline{1+r}^{t}}{s^2, B}$
3	a, p, n, r,	$t = \frac{L.\overline{1+r}^{n} - 1 - L.\overline{1+r}^{n} - L.r + L.a - L.p}{L.\overline{1+r}} = \frac{L.a + 2L.s, B - L.r - L.p}{L.\overline{1+r}}$
4	a, p, r, t	$n = \frac{-L.1 - \frac{pr \times \overline{1+r}^{t}}{a}}{L.\overline{1+r}} = \frac{2\,L.fec, F}{L.\overline{1+r}}$
5	a, p, n, t	Required r? $o = \frac{pr}{a} \times \overline{1+r}^{t} \times \frac{\overline{1+r}^{n}}{\overline{1+r}^{n} - 1} - 1 = \frac{p}{a} \times t^2, A \times \overline{fec^2\,A}^{t} \times co\text{-}fec^2, B - 1$ Assume different values of A, and thence find the correſponding values of B, till the expreſſion is $= o$ Then $1 + r = fec^2, A$

3. Let p be the preſent worth of an eſtate in fee-ſimple, whoſe annual rent is a, at the rate or gain r on 1l. per an.

Then $a = pr$.

4. Let n be the number of years purchaſe that will buy an eſtate in fee-ſimple, at the rate or gain r on 1l. per an.

Then $n = \frac{2}{r}$; and $r = \frac{2}{n}$.

5. If an eſtate in fee-ſimple, whoſe annual rent is a, to commence t times hence, is worth p ready-money, at the rate r on 1l. per an. Any three of the terms a, p, r, t being given, to determine the fourth.

Given a, r, t; $p = \frac{a}{r \times \overline{1+r}^{t}}$

Given p, r, t; $a = pr \times \overline{1+r}^{t}$

Given a, p, r; $t = \frac{L.a - L.p - L.r}{L.\overline{1+r}}$

Given a, p, t; to find r? $\frac{pr}{a} \times \overline{1+r}^{t} - 1 = o$ Aſſume different values of r till the expreſſion is $= o$

6. What ſum p at compound intereſt, in the time N amounts to M, and in the time n amounts to m?

$L.p = \frac{N\,L.m - n\,L.M}{N - n}$

7. If the ſum p, at compound intereſt, in the time n amounts to m; what will be the amount M of that ſum p in the time N? $L.M = \frac{N \times \overline{L.m - L.p} + n\,L.p}{n}$

8. If

8. If the ſum p, at compound intereſt, in n years amounts to m; in what time N will that ſum p amount to M? $N = \frac{n \times \overline{L.M - L.p}}{\overline{L.M - L.p}}$

9. If the ſums B, C, D, E are to be paid b, c, d, e years (or ſpaces of time) hence; to find the time t when the ſum $p = B + C + D + E$ may be paid without detriment to either party, at a given rate r of compound intereſt? $t = \frac{\overline{L.p - L.\ \frac{B}{\overline{1+r}^{b}} + \frac{C}{\overline{1+r}^{c}} + \frac{D}{\overline{1+r}^{d}} + \frac{E}{\overline{1+r}^{e}}}}{\overline{L.1+r}^{t}}$

10. If the ſum a is to be paid, at each payment, for n ſeveral payments; to find the time t, when the whole ſum na may be paid all together, at a given rate r of compound intereſt?

$t = \frac{-\overline{L.1+r}^{n} - 1 + \overline{L.1+r}^{n} + L.n + L.r}{\overline{L.1+r}} = \frac{L.n + L.r - 2 \times L.s, B}{\overline{L.1+r}}$

If the debtor wiſhed to pay a ſum m greater or ſmaller than na, but greater than p, there would be found $t = \frac{L.m + L.r + n\,\overline{L.1+r} - L.a - \overline{L.\overline{1+r}^{n} - 1}}{\overline{L.1+r}} = \frac{L.m + L.r + n\,\overline{L.1+r} - L.a - 2\,L.t, B}{\overline{L.1+r}}$

If the debtor ſhould fix the time, at which he would pay his money, to be at the end of the given time t, and the ſum m be required which he ought to pay at this epoch, we ſhall have $L.m = t\,\overline{L.1+r} + L.a + \overline{L.\overline{1+r}^{n} - 1} - n\,\overline{L.1+r} - L.r = \overline{t-n} \times \overline{L.1+r} + L.a + 2\,L.t, B$

11. Let p be a principal money, which ſhould bring in pr annually, at the rate of r for 1l. per an.; a, a ſum greater or ſmaller than pr, which we will ſuppoſe to be paid by the debtor to the creditor at the end of each year; m′ the ſum to which, if the debtor paid nothing, the principal with intereſt upon intereſt would amount at the end of n years; m″ the amount of the ſum a paid annually, at the end of the ſame number of years; and m the ſum in which the debtor will be indebted to the creditor at the end of n years. It is evident that we ſhall have $m = m' - m''$: but $m = p \times \overline{1+r}^{n}$; and $m'' = \frac{a \times \overline{1+r}^{n} - a}{r}$: we ſhall then have $m = p \times \overline{1+r}^{n} - \frac{a \times \overline{1+r}^{n} - a}{r}$, by means of which, any four of theſe five quantities a, p, n, m, r being given we may find the fifth, as in the following table. Put $\frac{a}{mr} \times t^2, B = t^2, G$; and put $\frac{p}{m} \times \overline{1+r}^{n} = \frac{p}{m} \times \text{ſec.}^2, B = \text{ſec.}^2, H$, or $\frac{m}{p} \times c^2, B = c^2, H$, $\because \frac{p}{m} \times \overline{1+r}^{n} - 1 = t^2, H$. If $\frac{mr}{a}$ and $\frac{pr}{a}$ are greater than 1, put $\frac{mr}{a} = \text{ſec}^2, K$, or $\frac{a}{rm} = c^2, K$; and $\frac{pr}{a} = \text{ſec}^2, L$, or $\frac{a}{pr} = c^2, L$. But if $\frac{mr}{a}$ and $\frac{pr}{a}$ are leſs than 1, put $\frac{mr}{a} = s^2, M$, and $\frac{pr}{a} = s^2, N$.

CASE

CASE	GIVEN	REQUIRED.
1	a, p, n, r	$m = p \times \overline{1+r}^{n} - a \times \frac{\overline{1+r}^{n} - 1}{r} = p \times \overline{1+r}^{n} - \frac{a}{r} \times t^{2}, B$
2	a, m, n, r	$p = \frac{mr + a \times \overline{1+r}^{n} - 1}{\overline{1+r}^{n} \times r} = m \times c^{2}, B + \frac{a}{r} \times s^{2}, B = m \times c^{2}, B \times \text{sec}^{2}, G$
3	m, n, p, r	$a = \frac{r \times p \times \overline{1+r}^{n} - m}{\overline{1+r}^{n} - 1} = r\,m \times \frac{\frac{p}{m} \times \overline{1+r}^{n} - 1}{\overline{1+r}^{n} - 1} = \frac{rm \times t^{2}, H}{t^{2}, B}$
4	a, m, p, r	Required n? $n = \frac{L.\overline{mr-a} - L.\overline{pr-a}}{L.\overline{1+r}} = \frac{L.\overline{\frac{mr}{a} - 1} - L.\overline{\frac{pr}{a} - 1}}{L.\overline{1+r}} = \frac{2 \times \overline{L.t, K - L.t, L}}{L.\overline{1+r}}$ or $n = \frac{L.\overline{a-mr} - L.\overline{a-pr}}{L.\overline{1+r}} \; \frac{L.\overline{1-\frac{mr}{a}} - L.\overline{1-\frac{pr}{a}}}{L.\overline{1+r}} = \frac{2 \times \overline{L.c, M - L.c, N}}{L.\overline{1+r}}$. N. B. mr and pr muſt be both at the ſame time greater or leſs than a; elſe the problem will be impoſſible.
5	a, p, n, m	To find r? $\frac{p}{m} \times \overline{1+r}^{n} - \frac{a \times \overline{1+r}^{n} - 1}{mr} - 1 = 0 = \frac{p}{m} \times \text{sec}^{2}, B - \frac{a \times t^{2}, B}{m \times t^{2}, A} - 1$ Aſſume different values of A, and thence the correſpondent values of B by the equation $\overline{1+r}^{n} = \overline{\text{sec}^{2}, A}^{n} = \text{sec}^{2}, B$, till the equation above is $= 0$, then $1 + r = \text{sec}^{2}, A$, or $r = t^{2}, A$.

If the ſum a, inſtead of being paid annually by the debtor, was on the contrary lent to the ſame debtor at the end of each year, we ſhould only have to make a negative, or to change the ſigns of each of the terms in which it enters in the foregoing table. For caſe 4, put $\frac{mr}{a} = t^{2}, P$, and $\frac{pr}{a} = t^{2}, Q$.

Then $n = \frac{L.\overline{mr+a} - L.\overline{pr+a}}{L.\overline{1+r}} = \frac{L.\overline{\frac{mr}{a} + 1} - L.\overline{\frac{pr}{a} + 1}}{L.\overline{1+r}} = \frac{2 \times \overline{L.c, Q - L.c, P}}{L.\overline{1+r}}$

GENERAL PROPERTIES of PLANE TRIANGLES.

1. THE ſum of the three angles is equal to two right angles.

2. The greater ſide is oppoſed to the greater angle, and the leſs ſide to the leſs angle.

3. The ſum of any two ſides is greater than the third; and the difference of any two ſides is leſs than the third.

4. The

4. The triangle is equilateral, iſoſcelar, or ſcalene, according as it has its three angles all equal, or two of them equal, or all three unequal; and *vice verſâ*.

5. The angles oppoſite the two leaſt ſides are acute.

6. The obtuſe angle, if there is one, for there cannot be more, muſt be oppoſite the greateſt ſide.

7. Of the two ſegments intercepted between the perpendicular to the baſe and the two angles at the baſe, the greateſt ſegment lies next to the greateſt ſide, and the leaſt ſegment next to the leaſt ſide.

8. The greateſt angle at the baſe lies next the leaſt ſide, and leaſt ſegment; and the leaſt angle at the baſe lies next the greateſt ſide, and greateſt ſegment.

9. If the angles at the baſe are both acute, the perpendicular falls within the triangle; but *if* one of them is obtuſe the perpendicular falls without the triangle on the ſide of the obtuſe angle.

10. If both the ſegments of the baſe are leſs than the baſe, or both the ſegments of the vertical angle leſs than the vertical angle, the perpendicular falls within the triangle; but if either of the ſegments of the baſe is greater than the baſe, or either of the ſegments of the vertical angle is greater than the vertical angle, the perpendicular falls without the triangle.

The SOLUTIONS of the CASES of RIGHT-ANGLED PLANE TRIANGLES.

GIVEN	REQUIRED	CASE	SOLUTIONS.
Hyp. AC, and the angles.	One leg BC	1	Rad : s, A :: Hyp. AC : leg BC Hypotenuſe AC and one leg BC	The angles	2	AC : BC :: rad : s, A ; whoſe complement is the angle C. When BC is nearly equal to AC, or A is near 90°, and AC and BC are given to more than ſeven places of figures, or their difference to two or more places of figures, uſe one of theſe two rules. s, $\frac{1}{2}$ C $= \sqrt{\frac{AC-BC}{2AC}}$ or t $\frac{1}{2}$ C $= \sqrt{\frac{AC-BC}{AC+BC}}$; and complement of C = A.
	Other leg AB	3	Let the angles be found by caſe 2, and then the required leg AB by caſe 1. Or AB = AC × c,A = AC × s,C. Otherwiſe, AB $= \sqrt{\overline{AC-BC} \times \overline{AC+BC}}$
The angles and one leg BC	Hyp. AC	4	s, A : rad :: leg BC : hyp. AC
	Other leg AB	5	s, A : BC :: s, C : AB . . Or, rad : t, C :: BC : AB

	Hyp. AC	7	Let the angles be found by caſe 6; and then hypotenuſe AC by caſe 4. Or AC $= \frac{AB}{c,A} = \frac{BC}{s,A}$ Uſe the firſt or ſecond value of AC, according as A is under or over 45°.

The

The SOLUTIONS of the CASES of OBLIQUE PLANE TRIANGLES.

GIVEN	REQUIRED	CASE	SOLUTIONS.
The angles and one side AC	Either of the other sides, BC	1	s, B : AC :: s, A : BC Two sides AC, BC, and an angle B opposite one of them AC	The other angles A and ACB	2	AC : s, B :: BC : s, A ; which added to B, and the sum subtracted from 180° gives the other angle ACB.
	The other side AB	3	Let the angle ACB be found by the preceding case ; then it will be s, B : AC :: s, ACB : AB. If BC is less than AC, A is acute ; and, A, ACB, and AB have each one value only ; otherwise they have each two values.
Two sides AB, AC, and an included angle A	The other angles B and ACB	4	Sum of AB and AC : their diff. :: t, $\frac{1}{2}$ sum of ACB and B : t, $\frac{1}{2}$ their diff. which added to, and subtracted from their $\frac{1}{2}$ sum, gives the two angles. Otherwise; less side AC : greater side AB :: rad : t, of an angle. And rad : t, excess of this angle above 45° :: t, compl. $\frac{1}{2}$ A : t, of an angle ; which added to, and subtracted from, the compl. $\frac{1}{2}$ A, gives the two angles ACB and B, whereof the greater will be opposed to the greater side and the less to the less side.
	The other side BC	5	Let the angles be found by the last case, then BC by case 1. Otherwise put $\frac{2\,s,\frac{1}{2}A}{AB \sim AC}\sqrt{AB \times AC} = t,z$ Then $BC = \frac{AB \sim AC}{c,z} = \frac{2\,s,\frac{1}{2}A\sqrt{AB \times AC}}{s,z}$. Use the first or second of these two values of BC, according as z is less or greater than 45°.
All the three sides.	An angle suppose A or B	6	Let fall a perpendicular CD, upon the base AB, opposite the required angle A, or B. Then AB : sum of AC and BC :: their diff. : 2 DE or twice dist. of perpendicular from middle of the base. Then if AC, the side next to A, is greater than the other side BC, take AE + ED = AD, with which and AC the angle A will be found by case 2 of right-angled triangles. Or if B, the angle next the less side BC be required, take ED ~ EB = DB ; with which and BC the angle B will be found in like manner ; and if ED is greater than EB the perpendicular falls without the triangle, and the angle B is obtuse. If A and B be both required ; after finding A, say ; BD : AD :: t, A : t, B. Or after finding B, say ; AD : BD :: t, B : t, A. Whence the third angle C will be also given. Otherwise, $s, \frac{1}{2}A = \sqrt{\frac{\frac{1}{2}(BC+\overline{AB-AC}) \times \frac{1}{2}(BC-\overline{AB-AC})}{AB \times AC}}$ Or ; - - - $c, \frac{1}{2}A = \sqrt{\frac{\frac{1}{2}(\overline{AB+AC}+BC) \times \frac{1}{2}(\overline{AB+AC}-BC)}{AB \times AC}}$

GENERAL PROPERTIES of SPHERICAL TRIANGLES.

1. The greater side is opposed to the greater angle, and the less side to the less angle.

2. The sum of any two sides is greater than the third, and the difference of any two sides is less than the third.

3. The

3. The difference of any two ſides is leſs than 180°, and their ſum leſs than 360°.

4. The ſum of the three ſides is leſs than 360°.

5. The ſum of the three angles is greater than 180°, and leſs than 540°.

6. The external angle is leſs than the ſum of the two internal and oppoſite angles, but not by ſo much as 360°.

7. According as the ſum of any two ſides is greater, or leſs than, or equal to 180°, the ſum of their two oppoſite angles is alſo greater, or leſs than, or equal to 180°; or half the ſum of any two ſides is of the ſame kind with half the ſum of their two oppoſite angles.

8. There may be drawn two perpendiculars from the vertical angle to the baſe, one being the continuation of the other to 180°, and which cut the baſe in two points 180° aſunder, whether meaſured along the baſe or along the perpendiculars.

9. If any point be aſſumed in the baſe, as for inſtance, either extremity of it, or the middle of it, the neareſt perpendicular to it will be within 90° of it; and the furtheſt perpendicular from it will be more than 90° from it, but leſs than 180°.

10. Only one perpendicular can fall within the triangle, but both of them may fall without it.

11. The perpendicular oppoſite to or ſubtending one of the angles at the baſe may at the ſame time be neareſt to, that is, within 90° of both angles at the baſe; or it may be the neareſt to only one angle at the baſe, and the other perpendicular neareſt to the other angle at the baſe.

12. If the two angles at the baſe are of the ſame kind, or if the baſe is greater than its firſt ſegment, or the vertical angle is greater than its firſt ſegment, one of the perpendiculars let fall from the vertical angle on the baſe falls within the triangle; otherwiſe both the perpendiculars fall without it.

13. If the ſide, from the end of which the perpendiculars are let fall on the baſe, and the contiguous angle at the baſe be like, the neareſt perpendicular will fall oppoſite to or will ſubtend the angle at the baſe, and the furtheſt perpendicular will be oppoſite to or ſubtend the external angle at the baſe. But if the ſide and angle are unlike, the neareſt perpendicular will ſubtend the external angle at the baſe, and the furtheſt perpendicular will ſubtend the angle at the baſe.

14. According as any two ſides are of the ſame, or different kind, the ſegments of the third ſide are alſo of the ſame or different kind, and the ſegments of the vertical angle are likewiſe of the ſame or different kind.

15. A ſpheric triangle is equilateral, iſoſcelar, or ſcalene, according as it has its three angles all equal, or two of them equal, or all three unequal; and the contrary.

16. If from the three angles, as poles, there be deſcribed upon the ſurface of the ſphere three arches of a great circle, forming by their interſection a new ſpheric triangle, the angles taken in either triangle, and their oppoſite ſides in the other, will be ſupplements of each other.

17. A ſide and its oppoſite angle, and alſo another ſide or angle being given, the kinds of the other parts are doubtful.

GENERAL PROPERTIES of RIGHT-ANGLED SPHERIC TRIANGLES.

1. THE angles at the hypotenuſe and their oppoſite ſides are of the ſame kind.

2. The hypotenuſe is leſs or greater than a quadrant, according as the ſides are of the ſame or different kind; alſo, according as the angles at the hypotenuſe are of the ſame or different kind; and the contrary.

3. If the hypotenuſe be of 90°, one at leaſt of the ſides will be the ſame.

4. If the three ſides are each of 90°, the three angles will be the ſame; and the contrary.

5. Every ſide leſs than 90° is ſmaller than the hypotenuſe; and every ſide greater than 90° is greater than the hypotenuſe.

6. An oblique angle, if acute, can never be ſmaller; nor, if obtuſe, larger, than its oppoſite ſide.

7. The difference of the two oblique angles is leſs; and their ſum greater than 90°.

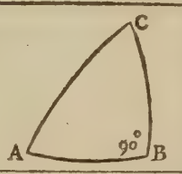
	16	The hypotenuſe AC	s, A : s BC :: Radius : s, AC, doubtful.



REMARKS.

REMARKS.

The ſpheric triangle ABC is right-angled in B. The two quantities, whether arcs or angles, marked with aſteriſcs in the ſame analogy, are both of the ſame kind; that is, both at the ſame time leſs, or both at the ſame time greater than 90°. The three laſt caſes are doubtful, ſince it cannot be determined by the data alone whether AB, C, and AC are leſs or greater than 90° each. In the remaining caſes, if the two given quantities, whether arcs or angles, which occur in the previous terms of the ſame analogy, are both of the ſame kind, the laſt term or anſwer required will be under 90°; but if they are of different kinds, the laſt term will be above 90°.

SOLUTIONS of OBLIQUE SPHERIC TRIANGLES.

(The character $<$ placed between two quantities denotes that the firſt is leſs than the ſecond, and the character $>$ placed in like manner, ſignifies that the firſt is greater than the ſecond. The character $\sim$ placed between two quantities denotes the difference of the quantities, whether the firſt or ſecond be the greateſt.)

GIVEN	CASE	REQUIRED	SOLUTIONS.

GIVEN	CASE	REQUIRED	SOLUTIONS.
Two ſides AC, BC, and an angle A oppoſite one of them BC	7	The angle B oppoſite the other given ſide AC	Let fall the perpendicular CD from the angle C contained between the given ſides AC, BC, upon the oppoſite ſide AB.  s, BC : s, AC :: s, A : s, B doubtful whether $<$ or $>$ 90°. The kind of B however may for the moſt part be determined by this propoſition, the ſum of the given ſides AC, BC, and the ſum of their oppoſite angles A, B, lie both on the ſame ſide of 180°, that is, are both leſs or both greater than 180° at the ſame time.
	8	The angle ACB contained between the given ſides AC, BC,	From the required angle ACB let fall the perpendicular CD upon the oppoſite ſide AB. R : c, AC :: t, A : cot, ACD $<$ or $>$ 90° as AC and A are like or unlike. t, BC : t, AC :: c, ACD : c, BCD $>$ 90° if one of, or all the three terms ACD, AC, BC, are $>$ 90°; otherwiſe $<$ 90°. ACD $\pm$ BCD = ACB doubtful on account of the ambiguity of the ſigns: which uncertainty may however be for the moſt part obviated by one of the two following rules; if the ſum of the ſegments ACD, BCD be $>$ 180°, take their difference, if the ſecond ſegment BCD be greater than the firſt ſegment ACD, take their ſum for the angle ACB.
	9	The third ſide BC	Let fall the perpendicular CD from the angle C contained between the two given ſides AC, BC, upon the oppoſite or required ſide AB. R : c, A :: t, AC : t, AD $<$ or $>$ 90° as A and AC are like or unlike. c, AC : c, BC :: c, AD : c BD $>$ 90° if one of, or all the three terms AD, BC, AC, are $>$ 90°; otherwiſe $<$ 90°. AD $\pm$ BD = AB doubtful; but may for the moſt part be determined by one of theſe two rules. If the ſum of the ſegments AD, BD is greater than 180°, take their difference; but if the ſecond ſegment BD is greater than the firſt ſegment AD, take their ſum for the ſide AB.
Two angles A, B, and a ſide AC oppoſite one of them B	10	The ſide BC oppoſite the other given angle A	Let fall the perpendicular CD from the angle C not given upon the oppoſite ſide AB  s, B : s, A :: s, AC : s, BC doubtful whether $<$ or $>$ 90°, but may however for the moſt part be determined from this conſideration, that the ſum of the given angles A, B, and the ſum of their oppoſite ſides AC, BC, lie both on the ſame ſide of 180°. If this rule is not ſufficient, or no other means are given to determine the kind of BC in this problem, it will be impoſſible to determine the value of the other parts of the triangle by the ſolutions of the two following problems.
	11	The ſide AB included between the given angles A, B.	Let fall the perpendicular CD from the angle C not given upon the oppoſite or required ſide AB. R : c, A :: t, AC : t, AD $<$ or $>$ 90° as A and AC are like or unlike. t, B : t, A :: s, AD : s, BD doubtful whether $<$ or $>$ 90°. AD $\pm$ BD = AB doubtful on account of the ambiguity of the ſigns, as well as of BD, but may often be determined by one of theſe two rules. If the ſum of the ſegments AD, BD, be greater than 180° take their difference. If the ſecond ſegment BD be greater than the firſt AD take their ſum for AB.
	12	The third angle ACB	Let fall the perpendicular CD from the required angle ACB upon the oppoſite ſide AB. R : c, AC :: t, A : cot, ACD $<$ or $>$ 90° as AC and A are like or unlike. c, A : c B :: s, ACD : s, BCD doubtful whether $<$ or $>$ 90°. ACD $\pm$ BCD = ACB doubtful on account of the ambiguity of the ſigns, as well as of BCD, but may often be determined by one of theſe two rules. If the ſum of the ſegments ACD, BCD be $>$ 180°, take their difference; if the ſecond ſegment BCD be $>$ then the firſt ACD, take their ſum, for ACB.

GENERAL PROPERTIES *of a* RECTILATERAL SPHERIC TRIANGLE, *or having one Side equal to* 90°.

Call the arch equal to 90° the quadrant, and call its oppoſite angle the hypotenuſal angle, and call the other ſides and angles ſimply ſides and angles.

1. The angles at the quadrant and their oppoſite ſides are of the ſame kind.

2. The hypotenuſal angle is greater or leſs than 90°, according as the angles at the quadrant are of the ſame or different kind; alſo according as the ſides are of the ſame or different kind.

3. If the hypotenuſal angle be of 90°, one at leaſt of the angles at the quadrant will be ſo, and its oppoſite ſide the ſame.

4. If the three ſides are each of 90°, the three angles will be the ſame, and the contrary.

5. Every angle leſs than 90° is leſs than the hypotenuſal angle, and every angle greater than 90° is greater than the hypotenuſal angle.

6. An acute angle cannot be greater, nor an obtuſe angle leſs than its oppoſite ſide.

7. The difference of the two ſides is leſs than 90° and their ſum leſs than 270°.

The SOLUTIONS of a RECTILATERAL SPHERIC TRIANGLE, or having one ſide equal to 90°.

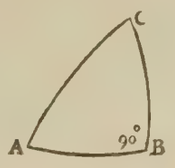
REMARKS.

The ſide AB of the ſpheric triangle ABC is equal to a quadrant, or 90 degrees. The two quantities whether arcs or angles, marked with aſteriſcs in the ſame analogy are both of the ſame kind, that is both at the ſame time leſs or both at the ſame time greater than 90°. The three laſt caſes are doubtful, ſince it cannot be determined by the things given alone whether A, BC, and C be leſs or greater than 90° each. In the remaining caſes, if the two given quantities, whether arcs or angles, which occur in the previous terms of the ſame analogy, are both of the ſame kind, the laſt term or anſwer required will be above 90°; but if they are of different kinds, the laſt term will be under 90°.

TABLE

TABLE of ACCURATE SOLUTIONS of CASES of RIGHT-ANGLED SPHERIC TRIANGLES by LOGARITHMS,

GIVEN	CASE	REQUIRED	QUALITY of Things REQUIRED	SOLUTION.
Hypotenuſe AC, and one angle A	1	Other angle C		c, AC + t, A − 10 = cot, C
	2	Contig. leg AB		t, AC + c, A − 10 = t, AB
	3	Oppoſite leg BC	extr. mean	s, AC + s, A* − 10 = s, BC* t, AC + c, A − 10 = t, AB {extr. c, AC+10−c, AB; mean c, AC+t, AB−s, AB} = c, BC like A
Hypotenuſe AC, and one leg AB	4	Other leg. BC	mean extr.	c, AC+10−c, AB = c, BC $\frac{t, \frac{1}{2}\overline{AC-AB}+t, \frac{1}{2}\overline{AC+AB}}{2}$ = t, ½ BC
	5	Oppoſite angle C	extr. mean	s, AB* + 10 − s, AC = s, C* $\frac{t, \frac{1}{2}\overline{AC+AB}+\cot, \frac{1}{2}\overline{AC-AB}}{2}$ = t, Z like AB; and 2 Z − 90° = C
	6	Contig. angle A	mean extr.	t, AB + cot, AC − 10 = c, A $\frac{s, \overline{AC-AB}+20-s, \overline{AC+AB}}{2}$ = t, ½ A
One leg AB, and contig. angle A	7	Other leg BC		s, AB + t, A* − 10 = t, BC*
	8	Oppoſite angle C	mean extr.	c, AB* + s, A − 10 = c, C* s, AB + t, A − 10 = t, BC {extr. c, A+10−c, BC; mean c, A+t, BC−s, BC} = s, C like AB.
	9	Hypotenuſe AC		t, AB + 10 − c, A = t, AC
Both legs, AB and BC	10	An angle A		s, AB + cot, BC* − 10 = cot, A*
	11	Hypotenuſe AC	mean extr.	c, AB + c, BC − 10 = c, AC s, AB + cot, BC − 10 = cot, A {extr. s, BC+cot, A−c, A; mean s, BC+10−s, A} = s, AC
Both angles, A and C	12	Hypotenuſe AC	mean extr.	cot, A + cot, C − 10 = c, AC $\frac{c, \overline{A+C}+20-c, \overline{A\sim C}}{2}$ = t, ½ AC
	13	A leg AB	mean extr.	c, C* + 10 − s, A = c, AB* $\frac{c, \overline{A+C}+20-c, \overline{A\sim C}}{2}$ = t, ½ AC. Then t, AC + c A − 10 = t, AB like C
One leg BC, and oppoſite angle A	14	Other leg AB	extr. mean	t, BC + cot, A − 10 = s, AB < or > 90 Find C by caſe 15, or AC by caſe 16, and rather the furtheſt from 90° then c, C + 10 − s, A or c, AC + 10 − c, BC = c, AB Otherwiſe, $\frac{s, \overline{A+BC}+20-s, \overline{A-BC}}{2}$ = t, X < 90°; and AB = 2 X − 90° or 270° − 2 X
	15	Contig. angle C	extr. mean	c, A + 10 − c, BC = s, C < or > 90° Find AB by caſe 14, or AC by caſe 16, and rather the furtheſt from 90°; Then c, AB + s, A − 10 or t, BC + cot, AC − 10 = c, C Otherwiſe, $\frac{\cot, \frac{1}{2}\overline{A+BC}+\cot, \frac{1}{2}\overline{A-BC}}{2}$ = t, y < 90°; and C = 2 y − 90, or 270 − 2 y
	16	Hypotenuſe AC	extr. mean	s, BC + 10 − s, A = s, AC < or > 90° Find AB by caſe 14, or C by caſe 15, and rather the furtheſt from 90°. Then c, AB + c, BC − 10 = c, AC; or t, BC + 10 − c, C = t, AC Otherwiſe, $\frac{t, \frac{1}{2}\overline{A+BC}+\cot, \frac{1}{2}\overline{A-BC}}{2}$ = t, Z < 90°; and AC = 2 Z − 90° or 270° − 2 Z



REMARKS

REMARKS neceſſary to explain the USE of the above TABLE.

1. By ſine, coſine, tangent, cotangent, are here meant the logarithmic ſine, coſine, tangent and cotangent.

2. If any arc is nearer 0° or 180° than 90°, that is $< 45°$ or $> 135°$, it is called an extreme arc; and if it is nearer 90° than 0° or 180°, that is between 45° and 135° it is called a mean arc.

3. The two quantities, whether arcs or angles, marked with aſteriſcs in the ſame equation, are both of the ſame kind, that is, both at the ſame time leſs, or both at the ſame time greater than 90°. The three laſt caſes are doubtful, ſince it cannot be determined from the things given, alone, whether AB, C, and AC are leſs or greater than 90° each. In the remaining caſes, if the two things given, whether arcs or angles, are of the ſame kind, the thing required will be $< 90°$; but if they are of different kinds, it will be $> 90°$.

The grounds of the ſolutions of the foregoing table, ſo far as they differ from thoſe of page 38, are as follow: This table is taken from that page, but adapted to logarithms, for the convenience of the Computer. The additions are deſigned to render the reſults accurate in all caſes; whereas the common rules would often introduce errors, on account of the limitation of the logarithms to ſeven decimal places of figures. The term required, when it comes out by a tangent or cotangent by the common rule, as in caſes 1, 2, 7, 9, 10, will be obtained accurately, viz. within $\frac{1}{10}$th of a ſecond, when the arc found is near 45°, and nearer when it is either leſs or greater, becauſe the difference of the logarithmic tangents and cotangents for the difference of one ſecond of the arc is 42 at an arc of 45°, and larger in every other part of the quadrant, till at 0° or 90° it becomes indefinitely great; and an error of half an unit may ariſe in each of the three logarithms concerned in the calculations, and no more, becauſe theſe tables have been ſtudiouſly made exact to the neareſt unit in the laſt place. The anſwer will be exact likewiſe by the common rule when it comes out by the ſine of an extreme arc, or by the coſine of a mean arc, becauſe the difference of the logarithms for one ſecond of the arc is large; but will be leſs and leſs accurate as the arc given by its ſine approaches 90°, or the arc given by its coſine approaches 0° or 180°, becauſe the logarithmic difference grows leſs and leſs, and at laſt vaniſhes. When the arc given by its ſine is diſtant 4° from 90°, or given by its coſine is diſtant 4° from 0° or 180°, the error may amount to one ſecond, and in proportion as the arc is nearer thoſe points the error will be greater, being inverſely as that diſtance. Therefore in theſe caſes, in order to obtain the like exactneſs as where the anſwer comes out by a tangent or cotangent, or by the ſine of a ſmall arc or the coſine of a large one, in the foregoing ſolutions, recourſe has been had to other ſolutions, which conſtitute the additions made to table page 38, beſides the reducing it to logarithmic calculation. Theſe new ſolutions introduced here, to be uſed inſtead of the common ones where they fail, proceed on theſe grounds; to find from the things given the tangent or cotangent of ſome other part of the triangle, and conſequently its arc exact, and then from that and one of the two original things given to find the arc required by a ſine if the common rule gave it by a coſine, or by a coſine if it gave it by a ſine, and conſequently exact, becauſe when the logarithmic difference belonging to the ſine is ſmall, that belonging to the correſponding coſine will be large, and the contrary.

Moreover,

Moreover, where two operations are pointed out in the table, there is uſed in the ſecond the ſine or coſine of the ſame arc whoſe tangent or cotangent was given by the firſt operation; to find which exact from the logarithmic tables, it would be neceſſary, where the logarithmic difference is large (as in the ſines of ſmall arcs or coſines of large ones) to find the arc previouſly from its tangent to a minute part of a ſecond, either by a vulgar, or decimal fraction, or a ſexageſimal of a lower denomination. To prevent this trouble, without leſſening the exactneſs, the logarithmic ſine of an extreme arc A is taken $=$ L. t, A $+$ L. c, A $-$ 10 or $=$ L. c, A $+$ 10 $-$ L. cot, A; or the log. coſine of a mean arc A is taken $=$ L. s, A $+$ 10 $-$ L. t, A or $=$ L. s, A $+$ L cot, A $-$ 10, where the tangent or cotangent of A is already given by the firſt operation, and the finding the ſine or coſine will be very eaſy, becauſe the logarithmic difference will be ſmall. In this way it will be ſufficient to bring out the arc in the firſt operation to $\frac{1}{100}$th of a ſecond.

There is another great advantage ariſing from this method, that if the reſult is required exact only within the limit of a ſecond, which is moſt commonly the caſe, the logarithms may then be taken out correſpondent to the arcs and the arcs correſpondent to the logarithms, directly from the tables by inſpection, without making any proportion for the logarithmic differences or odd parts of a ſecond, which is the part of the work that gives moſt trouble in calculations, and is moſt obnoxious to error.

Some of the new ſolutions are given by a peculiar rule, by one operation, the anſwer coming out by a tangent, and conſequently exact in all caſes, whether the ſimple rule fails or not.

TABLE of ACCURATE SOLUTIONS of OBLIQUE SPHERIC TRIANGLES by LOGARITHMS.

GIVEN	CASE	REQUIRED	SOLUTIONS.
Two ſides AB, AC, and included angle A;	1	Angle B, oppoſite one of the given ſides AC	Let fall the perpendicular CD from the unknown angle C which is not required, upon the oppoſite ſide AB t, AC + c, A − 10 = t, AD < or > 90° as AC and A are like or unlike. AB ∼ AD = BD.  AD { extr t, AD + c, AD + t, A + co-ar. s, BD − 20 ; mean s, AD + t, A + co-ar. s, BD − 10 } = t, B like or unlike A as AD is < or > AB. REMARK. B comes out liable to error when BC is ſmall or near 180°, which however is not to be conſidered as material in practice, becauſe a like error will ariſe from a ſmall error in any of the things given AB, AC, A.
	2	The third ſide BC	Let fall the perpendicular CD from one of the angles not given, as C, upon the oppoſite ſide AB t, AC + c, A − 10 = t, AD < or > 90° as AC and A are like or unlike. AB ∼ AD = BD AD { extr. co-ar. c, AD + c, BD + c, AC − 10 ; mean t, AD + co-ar. s, AD + c, BD + c, AC − 20 } = c BC < or > 90° as A and BD are like or unlike. REMARK. BC when ſmall will not come out exact from this rule by the tables, but the error will not exceed a ſmall fraction of a ſecond, as low as 14° or 15°, the leaſt; diſtance of the moon from the fixt ſtars ſet down in the Nautical Almanac. It may however be found very exact by either of the two following ſolutions. Otherwiſe, 2dly. Find the angle B by caſe 1, and thence BC as follows: B { extr. co-ar. c, B + t, BD ; mean t, B + co-ar. s, B + t, BD } = t, BC < or > 90° as A and BD are like or unlike. REMARK. BC will come out always exact if proportion be made for differences, and within 1½ without making any proportion, although the angle B may err much more when BC is ſmall, as abovementioned, which however will not affect BC more than here mentioned. Otherwiſe, 3dly. s, ½ A + co-ar. s, ½ $\overline{AB \sim AC}$ + ½ s, AB + ½ s, AC − 10 = t, Z Z { extr. co-ar. c, Z + s, ½ $\overline{AB \sim AC}$; mean t, Z + co-ar. s, Z + s, ½ $\overline{AB \sim AC}$ } = s, ½ BC REMARK. By making proportion of the differences, this rule will be exact to ¼″ if BC does not exceed 90°. Without any proportioning it will be exact to a ſecond, if BC is ſmall; and not err more than 2″ even when BC is 90°.
Two angles A, ACB and the ſide AC between them.	3	One of the other ſides BC	Let fall the perpendicular CD from the end C of the given ſide AC, which is next the required ſide BC, upon the oppoſite ſide AB. t, A + c, AC − 10 = cot, ACD < or > 90°, as A and AC are like or unlike. ACB ∼ ACD = BCD ACD { extr. c, ACD + t, AC + co-ar. c BCD − 10 ; mean cot, ACD + s, ACD + t, AC + co-ar. c BCD − 20 } = t, BC < or > 90° as A and BCD are like or unlike. REMARK. BC comes out liable to error when B is ſmall or near 180°, which however is not to be conſidered as material in practice, becauſe a like error will ariſe from a ſmall error in any of the things given A, ACB, and AC.
	4	The other angle B	Let fall the perpendicular CD from one of the given angles, as C, upon the oppoſite ſide AB t, A + c, AC − 10 = cot, ACD < or > 90°, as A and AC are like or unlike. ACB ∼ ACD = BCD ACD { extr. cot, ACD + co-ar. c, ACD + s, BCD + c, A − 20 ; mean co-ar. s, ACD + s, BCD + c, A − 10 } = c, B like or unlike A as ACD is < or > ACB. REMARK. B will not come out exact by this rule when ſmall; when = 7° the error however will not exceed a ſecond. It may however be found very exact by either of the two following ſolutions. Otherwiſe, 2dly. Find the ſegment BCD and the ſide BC by caſe 3. BC { extr. c, BC + t, BCD − 10 ; mean co-ar. t, BC to 20 + s, BC + t, BCD − 20 } = cot, B like or unlike A as ACD is < or > ACB. REMARK. BC will come out always exact if proportion be made for differences. But without any proportioning it will never err more than 1½″, although BC previouſly found may err much more when B is ſmall, as abovementioned, which however will not affect B more than here mentioned. Otherwiſe, 3dly. s, ½ AC + co-ar. c, ½ $\overline{A + C}$ + ½ s, A + ½ s; C − 10 = t, z Z { extr. c, ½ $\overline{A + C}$ + 10 − c, Z ; mean c, ½ $\overline{A + C}$ + t, Z + co-ar. s, z − 10 } = s, ½ B REMARK. By making proportion of the differences, this rule will be exact to ¼″, if B does not exceed 90°. But without any proportioning it will be exact to a ſecond if B is ſmall, and within two ſeconds if it is near 90°.

GIVEN	CASE	REQUIRED	SOLUTIONS.

Fig. 1

Fig. 2 
Fig. 3 
Fig. 4 
Let fall the perpendicular CD from an angle C not oppoſite the required ſide AC or BC, upon the oppoſite ſide AB; and let an arc CF be drawn within the triangle biſecting the vertical angle ACB, and let B be $>$ A, and conſequently AC $<$ BC.

t, $\frac{1}{2}\overline{A+B}+t$, $\frac{1}{2}\overline{B-A}+t$, $\frac{1}{2}$ ACB $-20=t$, Z or FCD $<90°$ being the angle contained between the arc CF and the neareſt perpendicular CD.

There are four caſes of this problem;

1. Fig. 1. $\frac{1}{2}\overline{A+B}<90°$, and Z $\frac{1}{2}>$ ACB; ACD $=$ Z $+\frac{1}{2}$ ACB, and BCD $=$ Z $-\frac{1}{2}$ ACB, and the perpendicular CD falls without the triangle on the ſide B.

2. Fig. 2. $\frac{1}{2}\overline{A+B}>90°$, and Z $>\frac{1}{2}$ ACB; ACD $=\frac{1}{2}$ ACB $+$ Z, and BCD $=\frac{1}{2}$ ACB $-$ Z, and the perpendicular CD falls within the triangle.

3. Fig. 3. $\frac{1}{2}\overline{A+B}>90°$, and Z $<\frac{1}{2}$ ACB; ACD $=\frac{1}{2}$ ACB $-$ Z, and BCD $=\frac{1}{2}$ ACB $+$ Z, and the perpendicular CD falls within the triangle.

4. Fig. 4. $\frac{1}{2}\overline{A+B}>90°$, and Z $>\frac{1}{2}$ ACB; ACD $=$ Z $-\frac{1}{2}$ ACB, and BCD $=$ Z $+\frac{1}{2}$ ACB, and the perpendicular CD falls without the triangle on the ſide A. Then

All the three		One of the	AC $\begin{cases}\text{Mean cot, } \overline{A+\text{cot ACD}}-10=\text{c, AC}\\ \text{extr. c, } \overline{A+\text{ACD}}+20-\text{c, } \overline{A\sim\text{ACD}}\end{cases}$ $\over 2$ $= t, \frac{1}{2}$ AC
angles		ſides	BC $\begin{cases}\text{Mean cot. } \overline{B+\text{cot, BCD}}-10=\text{c, BC}\\ \text{extr. c, } \overline{B+\text{BCD}}+20-\text{c, } \overline{B\sim\text{BCD}}\end{cases}$ $\over 2$ $= t, \frac{1}{2}$ BC
A	6	AC	
B		or	
C		BC	

The kind of AC and BC in the four ſeveral caſes will be as follows;

1. AC is $<$ or $>90°$ as A and ACD are like or unlike. BC is like A and unlike B.
2. AC is $<$ or $>90°$ as A and ACD are like or unlike. BC is like A and B.
3. AC is like A and B. BC is $<$ or $>90°$, as B and BCD are like or unlike.
4. AC is unlike A and like B. BC is $<$ or $>90°$ as B and BCD are like or unlike.

Otherwiſe, 2d Solution. Put the ſum of the angles $=$ S

$$\frac{\text{c, }\frac{1}{2}\text{S}+\text{c, }\overline{\frac{1}{2}\text{S}-\text{B}}+\text{co-ar. s, A}+\text{co-ar. s, C}}{2}=\text{s, }\tfrac{1}{2}\text{AC}$$

In words. Add together the logarithmic coſines of half the ſum of the three angles, and of the ſaid half ſum leſſened by the angle B oppoſite the required ſide AC, and the arithmetical complements of the logarithmic ſines of the other two angles A, C. Half the ſum of theſe four logarithms will be the logarithmic ſine of half the required ſide AC.

Remark. This rule fails when the required ſide AC is near 180°, but is proper to be uſed when AC is under 90°. When AC is greater than 90°, uſe the following rule;

Otherwiſe, 3d Solution. Let S repreſent the ſum of the angles, as in the preceding ſolution.

$$\frac{\text{c, }\overline{\frac{1}{2}\text{S}-\text{A}}+\text{c, }\overline{\frac{1}{2}\text{S}-\text{C}}+\text{co-ar. s, A}+\text{co-ar. s, C}}{2}=\text{c, }\tfrac{1}{2}\text{AC}$$

In words. Take half the ſum of the three angles, and its differences from each of the angles adjoining to the required ſide. To the logarithmic coſines of the ſaid differences add the arithmetical complements of the logarithmic ſines of the adjoining angles. Half the ſum of theſe four logarithms will be the logarithmic coſine of half the required ſide.

Remark. This rule fails, when the required ſide AC is near 0°, but is proper to be uſed when AC is above 90°, as the preceding rule is fitteſt to be uſed when AC is under 90°.

TABLE of ACCURATE SOLUTIONS of OBLIQUE SPHERIC TRIANGLES by LOGARITHMS continued.

GIVEN	CASE	REQUIRED	SOLUTIONS.
Two ſides AC, BC, and an angle A oppoſite one of them	7	The angle B oppoſite the other given ſide AC	Let fall the perpendicular CD from the angle C contained between the given ſides AC, BC, upon the oppoſite ſide AB.  B $\left\{\begin{array}{l}\text{extr. s, AC+s, A+co-ar. s, BC}-10=\text{s, B} \lessgtr \text{or} > 90^\circ \\ \text{mean. With AC and A find CD by caſe 3d, right-angled ſpherics, and with CD and BC find B by caſe 5,} \\ \text{do.} \lessgtr \text{or} > 90^\circ.\end{array}\right.$ The kind of B may however, for the moſt part, be determined by this propoſition. The ſum of the given ſides AC, BC, and the ſum of their oppoſite angles A and B lie both on the ſame ſide of 180°, that is, will both be leſs or both greater than 180° at the ſame time.
AC, BC, and an angle A oppoſite one of them	8	The included angle ACB	From the required angle ACB let fall the perpendicular CD upon the oppoſite ſide AB. c, AC + t, A − 10 = cot, ACD $\lessgtr$ or $>$ 90°, as AC and A are like or unlike. ACD $\left\{\begin{array}{l}\text{extr. c, ACD + t, AC + cot, BC} - 20 \\ \text{mean. cot, ACD + s, ACD + t, AC + cot, BC} - 30\end{array}\right\}$ c, BCD $>$ 90°, if one of, or all the three terms ACD, AC, BC are $>$ 90°; otherwiſe $<$ 90°. This value of BCD will be near enough the truth unleſs it be very near 0° or 180°. In that caſe with AC, and A find CD by caſe 3d right-angled ſpherics, and with BC and CD find BCD by caſe 6 do. Then ACD $\pm$ BCD = ACB doubtful on account of the ambiguity of the ſigns; which uncertainty may however, for the moſt part be obviated by one of the two following rules; if the ſum of the ſegments ACD, BCD $>$ 180° take their difference; if the ſecond ſegment BCD is greater than the firſt ſegment ACD take their ſum for the angle ACB.
BC	9	The third ſide AB	Let fall the perpendicular CD from the angle C contained between the two given ſides AC, BC, upon the oppoſite or required ſide AB. t, AC + c, A − 10 = t, AD $\lessgtr$ or $>$ 90° as AC and A are like or unlike. AD $\left\{\begin{array}{l}\text{extr. c, AD + c, BC + co-ar. c, AC} \\ \text{mean 20} - \text{t, AD + s, AD + c, BC + co-ar. c, AC} - 20\end{array}\right\}$ = c, BD $>$ 90°, if one of, or all three terms AD, BC, AC, are $>$ 90°; otherwiſe $<$ 90°. This value of BD will be near enough the truth unleſs it be near 0° or 180°. In that caſe with AC, and A find CD by caſe 3 of right-angled ſpheric triangles, and with BC and CD find BD by caſe 4 do. AD $\pm$ BD = AB, doubtful on account of the ambiguity of the ſigns, but may for the moſt part be determined by one of theſe two rules. If the ſum of the ſegments AD, BD is greater than 180°, take their difference; but if the ſecond ſegment BD is greater than the firſt ſegment AD, take their ſum for the ſide AB.

TABLE of ACCURATE SOLUTIONS of OBLIQUE SPHERIC TRIANGLES by LOGARITHMS continued.

GIVEN	CASE	REQUIRED	SOLUTIONS.
Two angles A, B,	10	The ſide BC oppoſite the other given angle A	Let fall the perpendicular CD from the angle C not given upon the oppoſite ſide AB.  BC $\begin{cases} \text{extr. s, A+s, AC+co-ar. s, B-10=s, BC} < \text{or} > 90°. \\ \text{mean. With AC and A find CD by caſe 3 right-angled ſpherics; and with CD and B find BC by caſe 16 do.} < \text{or} > 90°. \end{cases}$ The kind of BC however may for the moſt part be determined by this propoſition; the ſum of the given angles A, B and the ſum of their oppoſite ſides AC, BC lie both on the ſame ſide of 180°. If this rule is not ſufficient, or no other means are given to determine the kind of BC in this problem, it will be impoſſible to determine the value of the other parts of the triangle by the ſolutions of the two following problems.
and a ſide AC oppoſite one of them B.	11	The ſide AB included between the given angles A, B.	Let fall the perpendicular CD from the angle C not given upon the oppoſite or required ſide AB. c, A + t, AC − 10 = t; AD $<$ or $>$ 90° as A and AC are like or unlike. AD $\begin{cases} \text{mean. s, AD + t, A + cot, B - 20} \\ \text{extr. t, AD + c, AD + t, A + cot, B - 30} \end{cases}$ = s, BD $<$ or $>$ 90°. This value of BD will be near enough the truth unleſs it be near 90°. In that caſe, with AC and A find CD by caſe 3 right-angled ſpherics, and with CD and B find BD by caſe 14 do. AD ± BD = AB doubtful, on account of the uncertainty of the ſigns as well as of BD, but may often be determined by one of theſe two rules. If the ſum of the ſegments AD, BD be greater than 180° take their difference. If the ſecond ſegment BD be greater than the firſt AD take their ſum for AB.
	12	The third angle ACB	Let fall the perpendicular CD from the required angle ACB upon the oppoſite ſide AB. c, AC + t, A − 10 = cot; ACD $<$ or $>$ 90° as AC and A are like or unlike. ACD $\begin{cases} \text{mean. s, ACD + c, B + co-ar. c, A - 10} \\ \text{extr. 20 - cot, ACD + c, ACD + c, B + co-ar. c, A - 20} \end{cases}$ = s, BCD $<$ or $>$ 90°. This value of BCD will be near enough the truth unleſs it falls near 90°. In that caſe with AC and A find CD by caſe 3 of right-angled ſpherics, and with CD and B find BCD by caſe 15 do. $<$ or $>$ 90°. ACD ± BCD = ACB doubtful, on account of the ambiguity of the ſigns, as well as of BCD; but may often be determined by one of theſe two rules. If the ſum of the ſegments ACD, BCD $>$ 180°, take their difference: if the ſecond ſegment BCD be greater than the firſt ACD take their ſum for ACB.

REMARKS

REMARKS on the foregoing SOLUTIONS.

The foregoing ſolutions are contrived to produce accurate reſults in all caſes, that is liable to no greater errors than what might ariſe from an error of $\frac{1}{10}$ of a ſecond in the things given, whereas the rules commonly given by trigonometrical writers are frequently ſubject to conſiderable errors. The principles of theſe ſolutions are the ſame with thoſe of right-angled ſpheric triangles, which have been explained in the remarks following them.

It may be uſeful however to ſhew the reaſon of the preſent ſolutions independent of thoſe explanations, although it may appear partly a repetition of what has been mentioned before.

The errors occuring in the uſe of the common rules have two ſources; the one an inaccurate way of taking out the logarithmic ſine or coſine of the firſt arc, when the tabular difference is large; the other the uncertainty of the required arc found from its ſine or coſine, when the tabular difference is ſmall. In moſt of the foregoing ſolutions the firſt ſegment of the baſe or vertical angle, found by the firſt operation, comes out either by a tangent or a cotangent, and therefore may be obtained to the exactneſs of a ſmall fraction of a ſecond by theſe tables of logarithmic ſines and tangents, which go to ſeven decimal places of figures, even where the logarithmic difference is ſmalleſt, as at 45°, where 42 anſwers to one ſecond. In the ſecond operation the logarithmic ſine or coſine of the ſame arc or angle is made uſe of; and as the difference of the ſines of ſmall arcs and coſines of large ones is conſiderable, it will be neceſſary, where ſuch are concerned, previouſly to compute the firſt ſegment from its tangent or cotangent to a minute part of a ſecond, in order to get its logarithmic ſine or coſine true to the neareſt unit in the laſt place. In fact, if decimals are uſed, as many ſhould be taken as the logarithmic difference of the ſine or coſine has places. Thus in this caſe two operations are required, each attended with ſome trouble; to ſave which and ſtill preſerve the requiſite exactneſs, the following method is uſed in the foregoing ſolutions. Let A repreſent the firſt arc or ſegment, whoſe logarithmic tangent or cotangent is given by the firſt operation. Find the value of A from the table with the fractional part of a ſecond expreſſed by a vulgar fraction, having the difference between the given logarithm and that of the next leſs value of A in the table for its numerator, and the difference of the next leſs and greater logarithms in the table for its denominator; or by a decimal fraction carried to a ſufficient number of places. Then if the logarithmic tangent of A is given by the firſt operation you are in the ſecond operation for log. ſine of an extreme arc A or one nearer 0° or 180° than 90° to uſe L. t, A + L. c, A — 10; and for log. coſine of a mean arc A or one nearer 90° than 0° or 180° to uſe L. ſine, A + 10 — L. t, A. But if log. cotangent of A be given, then for log. ſine of an extreme arc A to uſe L. c, A + 10 — L. cot, A; or for log. coſine of a mean arc A to uſe L. s, A + L. cot, A — 10: where no more logarithms are required to be looked out than by the common rule, becauſe log. tangent of A or log. cotangent of A are already given by the firſt operation. The logarithmic ſine of a mean arc, or logarithmic coſine of an extreme arc is however ſtill to be uſed in the ſecond operation agreeable to the common rule.

This

This method is founded on theſe theorems; $s, A = \frac{t, A \times c, A}{Rad.} = \frac{c, A \times Rad.}{\cot, A}$; and $c, A = \frac{s, A \times Rad.}{t, A} = \frac{s, A \times \cot, A}{Rad.}$; and on this conſideration that where the logarithmic difference of the ſines is large that of the coſines is ſmall, and the contrary. Hence the logarithmic ſines or coſines uſed according to this method in the ſecond operation will be readily taken out on account of the ſmallneſs of the difference, and frequently even by inſpection; and the difficulty is obviated which might occur by the common method when the firſt ſegment is near 0°, or 180°, or 90°; and thoſe caſes are rendered the eaſieſt which before were moſt embarraſſing. In like manner it may be expedient generally in trigonometrical calculations to find the ſine of a ſmall angle or coſine of a large one from its tangent or cotangent, when they ſhould happen to be given by a preceding operation. This method does not indeed increaſe the accuracy of the reſult; but prevents the danger of miſtakes, and leſſens the labour of calculation by ſubſtituting the proportioning ſmaller differences inſtead of larger ones.

The other error which may ariſe from the uſe of the common rules, and which happens when the required arc comes out by a ſine or coſine, and the tabular logarithmic difference for one ſecond of the arc is ſmall, can be obviated no other way than by having recourſe to ſome other rule, which ſhall bring out the arc by a ſine if the common rule gave it by a coſine, or by a coſine if it gave it by a ſine; or in either caſe by a tangent or cotangent. This method therefore has been adopted in theſe caſes. Thus by the uſe of theſe ſeveral methods, varying from the common rules as often as occaſion requires, the foregoing ſolutions have been rendered ſufficiently accurate for the niceſt practice in all caſes.

Theſe improved ſolutions have moreover this very great advantage attending them, peculiar to themſelves as applied to theſe tables of logarithmic ſines and tangents to every ſecond of the quadrant, that they give the reſult true to the exactneſs of a ſecond or very little more, in the moſt uſual caſes, by only taking out the logarithm anſwering to the neareſt ſecond of the arc, or the neareſt arc to the logarithm, by inſpection, in the tables, without making any proportion for the logarithmic differences, or taking any account of the fractional parts of a ſecond; which conſiderably leſſens the labour of computation, and at the ſame time entirely obviates the danger of miſtakes in thoſe operations. In extraordinary caſes, ſuch as where one the ſides of the triangle is ſmall, the reſult indeed will not always come out ſo exact; but the error, even when apparently conſiderable, will be of no conſequence in practice, ſince it will be no more than what might ariſe from an alteration of a ſecond in any of the things given.

TABLE

TABLE of ACCURATE SOLUTIONS of a RECTILATERAL SPHERIC TRIANGLE, or having one side equal to 90°, by LOGARITHMS.

GIVEN	CASE	REQUIRED	QUALITY of Things REQUIRED	SOLUTION.
Hypotenusal angle C, and one side AC	1	Other side BC	- - -	c, C + t, AC − 10 = cot, BC
	2	Adj. angle A	- - -	t, C + c, AC − 10 = t, A
	3	Oppofite angle B	extr.	s, C + s, AC* − 10 = s, B*
			mean	t, C + c, AC − 10 = t, A $\left\{\begin{matrix}\text{extr. c, C + 10 − c, A}\\ \text{mean c, C + t, A − s, A}\end{matrix}\right\}$ = c, B like AC
Hypotenusal angle C, and one angle A	4	Other angle B	mean	c, C + 10 − c, A = c, B
			extr.	$\frac{\text{t, } \frac{1}{2}\overline{\text{A} \sim \text{C}} + \text{t, } \frac{1}{2}\overline{\text{A}+\text{C}}}{2} = \text{cot, } \frac{1}{2}\text{ B}$
	5	Oppofite fide BC	extr.	s, A* + 10 − s, C = s, BC*
			mean	$\frac{\text{cot, } \frac{1}{2}\overline{\text{A} \sim \text{C}} + \text{t, } \frac{1}{2}\overline{\text{A}+\text{C}}}{2} = \text{t, Z like A; and 2 Z} - 90° = \text{BC}$
	6	Adjacent fide AC	mean	cot, C + t, A − 10 = c, AC
			extr.	$\frac{\text{s, } \overline{\text{A} \sim \text{C}} + 20 - \text{s, } \overline{\text{A}+\text{C}}}{2} = \text{cot, } \frac{1}{2}\text{ AC}$
One angle A, and adjacent fide AC	7	Other angle B	- - -	s, A + t, AC* − 10 = t, B*
	8	Oppofite fide BC	mean	c, A* + s, AC − 10 = c, BC*
			extr.	s, A + t, AC − 10 = t, B $\left\{\begin{matrix}\text{extr. c, AC + 10 − c, B}\\ \text{mean c, AC + t, B − s, B}\end{matrix}\right\}$ = s, BC like A
	9	Hypote. angle C	- - -	t, A + 10 − c, AC = t, C
Both angles, A and B	10	A fide fuppofe AC	- - -	s, A + cot, B* − 10 = cot, AC*
	11	Hypote. angle C	mean	c, A + c, B − 10 = c, C
			extr.	s, A + cot, B − 10 = cot, AC $\left\{\begin{matrix}\text{extr. s, B + cot, AC − c, AC}\\ \text{mean s, B + 10 − s, AC}\end{matrix}\right\}$ = s, C
Both fides, AC and BC	12	Hypote. angle C	mean	cot, AC + cot, BC − 10 = c, C
			extr.	$\frac{\text{c, } \overline{\text{AC}+\text{BC}} + 20 - \text{c, } \overline{\text{BC} \sim \text{AC}}}{2} = \text{cot, } \frac{1}{2}\text{ C}$
	13	An angle fuppofe A	mean	c, BC* + 10 − s, AC = c, A*
			extr.	$\frac{\text{c, } \overline{\text{AC}+\text{BC}} + 20 - \text{c, } \overline{\text{AC} \sim \text{BC}}}{2} = \text{cot, } \frac{1}{2}\text{ C then t, C + c, AC} - 10 = \text{t, A like BC}$
One fide AC, and oppofite angle B	14	The other angle A	extr.	t, B + cot, AC − 10 = s, A < or > 90°
			mean	Find BC by cafe 15, or C by cafe 16, and rather the furtheft from 90°; then c, BC + 10 − s, AC, or c, C + 10 − c, B = c, A. Otherwife,
				$\frac{\text{s, } \overline{\text{B}+\text{AC}} + 20 - \text{s, } \overline{\text{B} \sim \text{AC}}}{2} = \text{t, X} < 90°;$ and A = 2 X − 90° or 270° − 2 X
	15	Adj. fide BC	extr.	c, AC + 10 − c, B = s, BC < or > 90°
			mean	Find A by cafe 14, or C by cafe 16, and rather the furtheft from 90°; then c, A + s, AC − 10 or t, B + cot, C − 10 = c, BC Otherwife,
				$\frac{\text{cot, } \frac{1}{2}\overline{\text{B}+\text{AC}} + \text{cot. } \frac{1}{2}\overline{\text{B} \sim \text{AC}}}{2} = \text{t, Y} < 90°, \text{ and BC} = 2\text{ Y} - 90°, \text{ or } 270° - 2\text{ Y}$
	16	Hypote. angle C	extr.	s, B + 10 − s, AC = s, C < or > 90°
			mean	Find A by cafe 14, or BC by cafe 15, and rather the furtheft from 90°; then c, A + c, B − 10 = c, C; or t, B + 10 − c, BC = t, C. Otherwife,
				$\frac{\text{t, } \frac{1}{2}\overline{\text{B}+\text{AC}} + \text{cot, } \frac{1}{2}\overline{\text{B} \sim \text{AC}}}{2} = \text{t, Z} < 90°, \text{ and C} = 2\text{ Z} - 90°, \text{ or } 270° - 2\text{ Z}$

REMARKS neceſſary to explain the USE of the above TABLE.

The two quantities, whether arcs or angles, marked with aſterics, in the ſame equation, are both of the ſame kind, that is both at the ſame time leſs or both at the ſame time greater than 90°. The three laſt caſes are doubtful, ſince it cannot be determined from the things given alone, whether A, BC, and C, are leſs or greater than 90°. In the remaining caſes, if the two things given, whether arcs or angles, are of the ſame kind, the thing required will be greater than 90°; but if they are of different kinds it will be leſs than 90°.

The ſolutions are founded on the ſame principles as thoſe of right-angled ſpheric triangles on page 8, and are equally exact with them; this rectilateral ſpheric triangle being the ſupplemental triangle to the right-angled one.

Here follow fifteen Problems, together with their Solutions, illuſtrating the Uſe of the LOGARITHMIC TABLES.

I. To find n mean proportionals between two quantities a and b, of which b is the leaſt?

Solution. The mth. mean proportional reckoned from b is $b \times \overline{\frac{a}{b}}^{\frac{m}{n+1}}$, and the mth. mean proportional reckoned from a is $a \times \overline{\frac{b}{a}}^{\frac{m}{n+1}} = a \div \overline{\frac{a}{b}}^{\frac{m}{n+1}}$

By logarithms. Multiply the difference of the logarithms of a and b by the fraction $\frac{m}{n+1}$, the product added to the logarithm of b will give the logarithm of the mth. mean proportional reckoned from b, or ſubtracted from the logarithm of a will give the logarithm of the mth. mean proportional reckoned from a.

II. The logarithms of a and b being given, to find the logarithm of a + b?

Solution. Put $\sqrt{\frac{b}{a}} = t, z$. Then $a + b = a \times \overline{1 + \frac{b}{a}} = a \times \overline{1 + t^2, z} = a \times \sec^2, z = \frac{a}{c^2, z}$.

By logarithms. $\frac{L.\,b + 20 - L.\,a}{2} = L.\,t, z$. Then $L.\overline{a+b} = L.\,a + 20 - 2\,L.\,c, z = L.\,b + 20 - 2\,L.\,s, z$.

Uſe the firſt expreſſion, if z is an extreme arc; and the ſecond expreſſion, if it is a mean arc.

III. The logarithms of a and b being given, to find the logarithm of a − b?

Solution. Put $\sqrt{\frac{b}{a}} = s, z$. Then $a - b = a \times \overline{1 - \frac{b}{a}} = a \times \overline{1 - s^2, z} = a \times c^2, z$

By logarithms. Put $\frac{L.\,b + 20 - L.\,a}{2} = L.\,s, z$. Then $L.\,\overline{a - b} = L.\,a + 2\,L.\,c, z - 20$

IV. The

IV. The logarithms of a and b being given, to find the logarithm of $\sqrt{a^2 + b^2}$?

Solution. Put $\frac{b}{a} = t, z$. Then $\sqrt{a^2+b^2} = a\sqrt{1 + \frac{b^2}{a^2}} = a \times \text{sec}, z = b \times \text{cosec}, z$

By logarithms. Put L. b + 10 − L. a = L. t, z. Then L. $\sqrt{a^2+b^2}$ = L. a + 10 − L. c, z = L. b + 10 − L. s, z. Uſe the firſt expreſſion, if z is an extreme arc, and the ſecond if it is a mean arc.

V. The logarithms of a and b being given, to find the logarithm of $\sqrt{a^2 - b^2}$?

Solution. Put $\frac{b}{a} = s, z$. Then $\sqrt{a^2-b^2} = a\sqrt{1 - \frac{b^2}{a^2}} = a \times c, z$

By logarithms. L. b + 10 − L. a = L. s, z. Then L. $\sqrt{a^2-b^2}$ = L. a + L. c, z − 10

VI. The logarithms of a and b being given, to find the logarithm of $\sqrt{a + b}$?

Solution. Put $\sqrt{\frac{b}{a}} = t, z$. Then $\sqrt{a+b} = \sqrt{a} \times \sqrt{1 + \frac{b}{a}} = \sqrt{a} \times \sqrt{1 + t^2}, z = \sqrt{a} \times \text{sec}, z = \frac{\sqrt{a}}{c, z}$

By logarithms. Put $\frac{\text{L. b} + 20 - \text{L. a}}{2} = \text{L. t}, z$. Then L. $\sqrt{a+b}$ = ½ L. a + 10 − L. c, z or = ½ L. b + 10 − L. s, z. Uſe the firſt expreſſion if z is a ſmall arc, and the ſecond if it is a large one.

VII. The logarithms of a and b being given, to find the logarithm of $\sqrt{a - b}$?

Solution. Put $\sqrt{\frac{b}{a}} = s, z$. Then $\sqrt{a-b} = \sqrt{a} \times \sqrt{1 - \frac{b}{a}} = \sqrt{a} \times \sqrt{1 - s^2}, z = \sqrt{a} \times c, z$

By logarithms. Put $\frac{\text{L. b} + 20 - \text{L. a}}{2} = \text{L. s}, z$. Then L. $\sqrt{a-b}$ = ½ L. a + L. c, z − 10.

VIII. The logarithms of a and b being given, to find the logarithm of $\overline{a \pm b}^{\frac{m}{n}}$, and the logarithm of $\overline{a+b}^{\frac{m}{n}} + \overline{a-b}^{\frac{m}{n}}$, and alſo the logarithm of $\overline{a+b}^{\frac{m}{n}} - \overline{a-b}^{\frac{m}{n}}$?

Solution. Put $\frac{b}{a} = s, z$; and $t, \overline{45° - \frac{1}{2}z}^{\frac{m}{n}} = t, u$. Then $\overline{a \pm b}^{\frac{m}{n}} = \overline{a \times c, z \times t, 45° \pm \frac{1}{2}z}^{\frac{m}{n}} = \overline{a \times c, z}^{\frac{m}{n}} \times \text{cot}, u$, or $\overline{a \times c, z}^{\frac{m}{n}} \times t, u$. Hence $\overline{a+b}^{\frac{m}{n}} \pm \overline{a-b}^{\frac{m}{n}} = \overline{a \times c, z}^{\frac{m}{n}} \times \overline{\text{cot}, u \pm t, u}$; and $\overline{a+b}^{\frac{m}{n}} + \overline{a-b}^{\frac{m}{n}} = \overline{a \times c, z}^{\frac{m}{n}} \times 2 \times \text{cosec}, 2u$; and $\overline{a+b}^{\frac{m}{n}} - \overline{a-b}^{\frac{m}{n}} = \overline{a \times c, z}^{\frac{m}{n}} \times 2 \times \text{cot}, 2u$.

By logarithms. Put L. b + 10 − L. a = L. s, z; and $\frac{m}{n} \times$ L. t, $\overline{45° - \frac{1}{2}z}$ = L. t, u. Then L. $\overline{a \pm b}^{\frac{m}{n}} = \frac{m}{n} \times \overline{\text{L. a} + \text{L. c}, z + \text{L. t}, 45° \pm \frac{1}{2}z - 20}$

And L. $\overline{a+b}^{\frac{m}{n}} + \overline{a-b}^{\frac{m}{n}} = \frac{m}{n} \times \overline{\text{L. a} + \text{L. c}, z - 10} + \text{L. 2} + 10 - \text{L. s}, 2u$.

And L. $\overline{a+b}^{\frac{m}{n}} - \overline{a-b}^{\frac{m}{n}} = \frac{m}{n} \times \overline{\text{L. a} + \text{L. c}, z - 10} + \text{L. 2} + \text{L. cot}, 2u - 10$.

IX. The

IX. The logarithms of a and b being given, to find the power of the impoſſible binominal $a \pm \sqrt{-b^2}$ whoſe index is $\frac{m}{n}$, that is, to find $\overline{a \pm \sqrt{-b^2}}^{\frac{m}{n}}$ by another impoſſible binomial; and thence the value of $\overline{a + \sqrt{-b^2}}^{\frac{m}{n}} + \overline{a - \sqrt{-b^2}}^{\frac{m}{n}}$, which is always poſſible, whether a or b be greateſt?

Solution. Put $\frac{b}{a} = t, z$. Then $\overline{a \pm \sqrt{-b^2}}^{\frac{m}{n}} = \overline{a^2+b^2}^{\frac{m}{2n}} \times c, \frac{m}{n} z \pm \sqrt{-s^2}, \frac{m}{n} z$. Hence $\overline{a + \sqrt{-b^2}}^{\frac{m}{n}} + \overline{a - \sqrt{-b^2}}^{\frac{m}{n}} = \overline{a^2+b^2}^{\frac{m}{2n}} \times 2\,c, \frac{m}{n} z = \overline{a \times sec, z}^{\frac{m}{n}} \times 2\,c, \frac{m}{n} z = \overline{b \times cosec, z}^{\frac{m}{n}} \times 2\,c, \frac{m}{n} z$; where the firſt or ſecond of theſe two laſt expreſſions is to be uſed according as z is an extreme or mean arc; or rather, becauſe $\frac{b}{a}$ is not only the tangent of z, but alſo of $z + 360°$, $z + 720°$ &c. therefore the factor in the anſwer will have ſeveral values, viz. $2\,c, \frac{m}{n} z$; $2\,c, \frac{m}{n} \times \overline{z + 360}$; $2\,c, \frac{m}{n} \times \overline{z + 720°}$ &c. the number of which, if m and n be whole numbers, and the fraction $\frac{m}{n}$ be in its leaſt terms, will be equal to the denominator n; otherwiſe infinite.

By logarithms. Put L. b + 10 — L. a = L. t, z. Then L. $\overline{\overline{a + \sqrt{-b^2}}^{\frac{m}{n}} + \overline{a - \sqrt{-b^2}}^{\frac{m}{n}}} = \frac{m}{n} \times$ L. a + 10 — L. c, z + L. 2 + L. c, $\frac{m}{n} z$ — 10 $= \frac{m}{n} \times$ L. b + 10 — L. s, z + 2 + L. c, $\frac{m}{n} z$ — 10; where the firſt or ſecond expreſſion is to be uſed, according as z is an extreme or mean arc. Moreover by taking ſucceſſively, L. c, $\frac{m}{n} z$; L. c, $\frac{m}{n} \times \overline{z + 360}$; L. c, $\frac{m}{n} \times \overline{z + 720°}$ &c. There will ariſe ſeveral diſtinct anſwers to the queſtion, agreeable to the remark above.

X. To find the roots of a quadratic equation, when poſſible?

There are four forms of quadratic equations. Theſe with their ſolutions are given as follow:

1. $x^2 - px - q = o$ | $\frac{2\sqrt{q}}{p} = t, z$. Then 1ſt $x = \frac{p}{2} \times t, z \times \cot, \frac{1}{2} z$; and 2d $x = -\frac{p}{2} \times t, z \times t, \frac{1}{2} z$
2. $x^2 + px - q = o$ | The roots of the ſecond form are negatives of thoſe of the firſt.
3. $x^2 - px + q = o$ | $\frac{2\sqrt{q}}{p} = s, z$. Then 1ſt $x = \frac{p}{2} \times s, z \times \cot, \frac{1}{2} z$; and 2d $x = \frac{p}{2} \times s, z \times t, \frac{1}{2} z$
4. $x^2 + px + q = o$ | The roots of the fourth form are negatives of thoſe of the third.

The roots of the firſt and ſecond forms are always poſſible. Thoſe of the third and fourth forms are alſo poſſible if $\frac{2\sqrt{q}}{p}$ is not greater than unity; otherwiſe they are impoſſible.

By logarithms. *Form 1ſt.* L. 2 + $\frac{1}{2}$ L. q + 10 — L. p = L. t, z. Then L. 1ſt. x, poſitive = L. $\frac{p}{2}$ + L. t, z + L. cot, $\frac{1}{2} z$ — 20; and L. 2d. x, negative = L. $\frac{p}{2}$ + L. t, z + L. t, $\frac{1}{2} z$ — 20.

Form 2d. Its roots will be negatives of thoſe of the firſt form.

Form 3d. L. 2 + $\frac{1}{2}$ L. q + 10 — L. p = L. s, z. Then L. 1ſt. x, poſitive = L. $\frac{p}{2}$ + L. s, z + L. cot, $\frac{1}{2} z$ — 20; and L. 2d. x, poſitive, = L. $\frac{p}{2}$ + L. s, z + L. t, $\frac{1}{2} z$ — 20.

Form 4th. Its roots are negatives of thoſe of the third form.

If L. 2 + $\frac{1}{2}$ L. q + 10 — L. p comes out greater than 10, the roots of the third and fourth forms are impoſſible.

XI. *Solution.*

XI. *Solution of Cubic Equations.*

The following method is adapted to a Cubic Equation, wanting the ſecond term; therefore, if the Equation has the ſecond term, it muſt be firſt taken away in the uſual manner. There are four forms of Cubic Equations wanting the ſecond term, whoſe roots, according to known rules, equivalent to Cardan's, are as follow:

1ſt. $x^3 + px - q = 0$ - - $x = \sqrt[3]{\frac{q}{2} + \sqrt[2]{\frac{q^2}{4} + \frac{p^3}{27}}} - \sqrt[3]{-\frac{q}{2} + \sqrt[2]{\frac{q^2}{4} + \frac{p^3}{27}}}$

2d. $x^3 + px + q = 0$ - - $x = \sqrt[3]{-\frac{q}{2} + \sqrt[2]{\frac{q^2}{4} + \frac{p^3}{27}}} - \sqrt[3]{\frac{q}{2} + \sqrt[2]{\frac{q^2}{4} + \frac{p^3}{27}}}$

3d. $x^3 - px - q = 0$ - - $x = \sqrt[3]{\frac{q}{2} + \sqrt[2]{\frac{q^2}{4} - \frac{p^3}{27}}} + \sqrt[3]{\frac{q}{2} - \sqrt[2]{\frac{q^2}{4} - \frac{p^3}{27}}}$

4th. $x^3 - px + q = 0$ - - $x = -\sqrt[3]{\frac{q}{2} - \sqrt[2]{\frac{q^2}{4} - \frac{p^3}{27}}} - \sqrt[3]{\frac{q}{2} + \sqrt[2]{\frac{q^2}{4} - \frac{p^3}{27}}}$

The roots of the firſt and ſecond forms are negatives of each other; and thoſe of the third and fourth are alſo negatives of each other. The firſt and ſecond forms have only root each. The third and fourth forms have alſo only root each, when the quadratic ſurd $\sqrt{\frac{q^2}{4} - \frac{p^3}{27}}$ is poſſible; but have three roots each when that ſurd is impoſſible. The roots of all the four forms may, in all caſes, be eaſily computed as follows:

Forms 1ſt and 2d. Put $\frac{q}{2} \times \left.\frac{3}{p}\right|^{\frac{3}{2}} = t, z$; and $\sqrt[3]{t, 45 - \frac{1}{2}z} = t, u$. Then $x = \pm\sqrt{\frac{4p}{3}} \times \cot. 2u$, where the upper ſign belongs to the firſt form, and the lower ſign to the ſecond form.

Forms 3d and 4th. Put $\frac{2}{q} \times \left.p\right|^{\frac{3}{2}}$ if $<$ unity, elſe its reciprocal $\frac{q}{2} \times \left.\frac{3}{p}\right|^{\frac{3}{2}} = c, z$.

Caſe 1ſt. $\frac{2}{q} \times \left.\frac{p}{3}\right|^{\frac{3}{2}} <$ unity. Put $\sqrt[3]{t, 45^\circ - \frac{1}{2}z} = t, u$. Then $x = \pm\sqrt[2]{\frac{4p}{3}} \times$ coſec, $2u$; where the upper ſign belongs to the third form, and the lower ſign to the fourth form.

Caſe 2d. $\frac{2}{q} \times \left.\frac{p}{3}\right|^{\frac{3}{2}} >$ unity. x has 3 values, in each form; viz. $x = \pm\sqrt{\frac{4p}{3}} \times c, \frac{z}{3} = \mp\sqrt[2]{\frac{4p}{3}} \times c, \overline{60^\circ - \frac{z}{3}}$ $= \mp\sqrt[2]{\frac{4p}{3}} \times c, \overline{60^\circ + \frac{z}{3}}$; where the upper ſigns belong to the third form, and the lower ſigns to the fourth form.

By logarithms. *Forms 1ſt and 2d.* $\text{L.}\frac{q}{2} + 10 - \frac{3}{2} \times \text{L.}\frac{p}{3} = \text{L. } t, z$; and $\frac{\text{L. } t, \overline{45^\circ - \frac{1}{2}z} + 20}{3} = \text{L. } t, u$ Then $\text{L. } x = \frac{1}{2}\text{L.}\frac{4p}{3} + \text{L. cot, } 2u - 10$; and x will be affirmative in the firſt form, and negative in the ſecond form.

Forms 3d and 4th. $^3 \times \text{L.}\frac{p}{3} + 10 - \text{L.}\frac{q}{2}$ being leſs than 10 (which is caſe 1ſt) or $\text{L.}\frac{q}{2} + 10 - \frac{3}{2} \times$ $\text{L.}\frac{p}{3}$ being leſs than 10 (which is caſe 2d) $= \text{L. } c, z$.

Caſe 1ſt. $\frac{\text{L. } t, 45^\circ - \frac{1}{2}z + 20}{3} = \text{L. } t, u$. Then $\text{L. } x = \frac{1}{2}\text{L.}_{4p} + 10 - \text{L. } s, 2u$: and x will be affirmative in the third form, and negative in the fourth form.

Caſe 2d. x has three values. 1ſt L. $\pm x = \frac{1}{2}$ L. $\frac{4p}{3}$ + L. c, $\frac{z}{3} - 10$. 2d L. $\mp x = \frac{1}{2}$ L. $\frac{4p}{3}$ + L. c, $\overline{60^\circ - \frac{z}{3}}$. 3d L. $\mp x = \frac{1}{2}$ L. $\frac{4p}{3}$ + L. c, $\overline{60^\circ + \frac{z}{3}} - 10$; where the upper ſigns belong to the third form, and the lower ſigns to the fourth form; that is the firſt value of x in the 3d form is poſitive, and its 2d and 3d values negative; and the firſt value of x in the fourth form is negative, and its 2d and 3d values affirmative.

XII. The altitudes of the barometer at two ſtations, with the heights of Fahrenheit's thermometer attached to the barometer, and the heights of two thermometers of the ſame kind, expoſed to the air but ſheltered from the ſun at the two ſtations, being given, to find the perpendicular altitude of one ſtation above the other?

Put B for the obſerved height of the barometer at the lower ſtation, and b for that at the upper ſtation, D for the difference of height of Fahrenheit's thermometer attached to the barometer at the two ſtations, and F for the mean of the two heights of Fahrenheit's thermometer expoſed freely for a few minutes to the open air, in the ſhade, at the two ſtations. The altitude of the upper ſtation above the lower, in Engliſh fathoms, will be expreſſed as follows, according to the reſpective obſervations of M. de Luc, the late General Roy, and Sir George Shuckburgh, in which the upper ſign — is to be uſed when the thermometer attached to the barometer is higheſt at the lower ſtation (which is moſt uſual) and the lower ſign + when it is loweſt at the lower ſtation.

M. de Luc - - - $\overline{\text{L. B} - \text{L. b} \mp 0,452\ \text{D}} \times \overline{1 + \text{F} - 40^\circ} \times 0,00223$

General Roy - - - $\overline{\text{L. B} - \text{L. b} \mp 0,468\ \text{D}} \times \overline{1 + \text{F} - 32^\circ} \times 0,00245$

Sir George Shuckburgh $\overline{\text{L. B} - \text{L. b} \mp 0,440\ \text{D}} \times \overline{1 + \text{F} - 32^\circ} \times 0,00243$

Mean of the two laſt - $\overline{\text{L. B} - \text{L. b} \mp 0,454\ \text{D}} \times \overline{1 + \text{F} - 32^\circ} \times 0,00244$

The obſervations of General Roy and Sir George Shuckburgh having been made with barometers and thermometers conſtructed and accurately divided by Mr. Ramſden, and with the detatched thermometers never expoſed to the ſun, appear to me clearly to deſerve the preference above thoſe of M. de Luc, who however, it muſt be acknowledged, has done great ſervice to ſcience by his ingenious labors and conſiderable improvements on this ſubject, as well as by exciting by his example the two other accurate obſervers to inſtitute ſimilar obſervations to his own, and with ſuperior advantages in point of inſtruments, in ſome meaſure to ſurpaſs himſelf. I have therefore, after the ſymbolical rules, ſuited to the experiments of all the three obſervers, ſet down a fourth rule, by taking a mean of the rules of the two latter obſervers. I ſhall now ſet down the ſame in common language, in order to render the calculation more generally practicable.

Take the difference of the tabular logarithms of the obſerved heights of the barometer at the two ſtations, conſidering the four firſt figures, excluſive of the index, as whole numbers, and the remaining figures

figures to the right as decimals, and ſubtract or add $\frac{454}{1000}^{th}$ of the difference of altitude of Fahrenheit's thermometer attached to the barometer at the two ſtations, according as it was higheſt at the lower or upper ſtation; thus you will have the height of the upper ſtation above the lower in Engliſh fathoms, nearly; to be corrected as follows: Multiply the height found nearly by the difference between the mean of the two altitudes of Fahrenheit's thermometer expoſed to the air at the two ſtations and 32°, and by the decimal fraction 0,00244; the product will be the correction of the approximate height, which added to or ſubtracted from the ſame, according as the mean of the two altitudes of Fahrenheit's thermometer expoſed to the air was higher or lower than 32°, will give the true height of the upper ſtation above the lower in Engliſh fathoms; which multiplied by ſix, will give the true height in Engliſh feet.

XIII. The right aſcenſion and declination of a celeſtial object, together with the obliquity of the ecliptic, being given, to find its longitude and latitude?

Put L. t, decl. + 10 — L. s, ℞ = L. t, A; N. North or S. South, as declination is. Call O the obliquity of the ecliptic in ſix firſt ſigns of ℞, S. or South; and in laſt ſix ſigns N. North. A + O, found according to their ſigns, as in algebra, = B.

A $\left\{\begin{array}{l}\text{Extr. co-ar. L. c, A + L. c, B + L. t, ℞ — 10 - -}\\ \text{Mean L. t, A + co-ar. L. s, A + L. c, B + L. t, ℞ — 20}\end{array}\right\}$ = L. t, long. of the ſame kind as ℞, unleſs B be more than 90°, in which caſe the quantity found of the ſame kind as ℞ ſubtracted from 12 ſigns will give the longitude. Otherwiſe, long. will be of the ſame kind, or in the ſame quadrant of the circle as ℞ is, unleſs B exceeds 90°, which can only happen when ℞ is in 2d ſemi-circle. Then, if ℞ be in 3d quadrant, or from 6ˢ to 9ˢ, longitude will be in 2d quadrant, or from 3ˢ to 6ˢ, and the operation will give L. cot. exceſs of long. above 3ˢ. Or if ℞ be in 4th quadrant, or from 9ˢ to 12ˢ, longitude will be in 1ſt quadrant; and the operation will give L. t, long. under 3ˢ, or in 1ſt quadrant.

Long. $\left\{\begin{array}{l}\text{Mean L. s, long. + L. t, B — 10}\\ \text{Extr. L. t, long. + L. c, long. + L. t, B — 20}\end{array}\right\}$ = L. t, lat. of ſame name as B.

XIV. The longitude and latitude of a celeſtial object, with the obliquity of the ecliptic, being given, to find its right aſcenſion and declination?

Put L. t, lat. + 10 — L. s, long. = L. t, A; N or S as latitude is. Call O the obliquity of the ecliptic, in firſt 6ˢ of long. N. and in laſt 6ˢ, S. A + O, found according to their ſigns or names, as in algebra, = B.

A $\left\{\begin{array}{l}\text{Extr. co-ar. L. c, A + L. c, B + L. t, Long. — 10. - - -}\\ \text{Mean L. t, A + co-ar. L. s, A + L. c, B + L. t, Long. — 20}\end{array}\right\}$ = L. t, ℞, of ſame kind as long. unleſs B be more than 90°, in which caſe the quantity found of ſame kind as long. ſubtracted from 12ˢ will give ℞.——Otherwiſe, ℞ will be of the ſame kind, or in the ſame quadrant of the circle as the long. is, unleſs

unleſs B exceeds 90°, which can only happen when long. is in 1ſt ſemi-circle. Then if long. be in 1ſt quadrant, ☊ will be in 4th quadrant; and the operation will give log. cot, exceſs of ☊ above 9ˢ. Or if long. be in 2d quadrant, ☊ will be in 3d quadrant, and the operation will give L. t, exceſs of ☊ above 6ˢ.

$$\text{☊} \left\{ \begin{array}{l} \text{Mean L. s, ☊} + \text{L. t, B} - 10 \\ \text{Extr. L. t, ☊} + \text{L. c, ☊} + \text{L. t, B} - 20 \end{array} \right\} = \text{L. t, declin. of ſame name as B.}$$

N. B. The longitude and latitude of a planet or zodiacal ſtar found by Problem XIII. and its right aſcenſion and declination found by Problem XIV. will be true to a ſecond or a very little more in all caſes, by only taking out the logarithms for the neareſt ſecond, and the neareſt ſecond anſwering to the logarithms, without proportioning for the differences of the logarithms, or for odd parts of a ſecond; and although the error in a ſtar's computed longitude or right aſcenſion may be augmented to many ſeconds, if the latitude or declination be conſiderable, yet as this error is meaſured upon the ſtar's parallel of latitude or parallel of declination, which grows ſmaller and ſmaller as the latitude or declination increaſes, the real error of the computed place of the ſtar upon the ſurface of the ſphere will not be greater in this caſe than the other, that is not above a ſecond or a little more. Now as the right aſcenſion and declination of a ſtar or planet given by the beſt inſtruments, and by the moſt accurate obſervations, namely thoſe on the meridian, cannot be depended upon nearer than five ſeconds, and oftentimes not nearer than twice that quantity, it may ſeem ſuperfluous to puſh the calculations to a greater exactneſs than this of a ſecond or a ſecond and half, which may be attained by this eaſy and compendious method of taking out the figures by ſight from theſe Tables of Logarithmic Sines and Tangents to every Second of the quadrant, which will much abridge the labor of a very important part of aſtronomical calculation, and thereby excite Aſtronomers to diligence as well in making as reducing their obſervations. See the principles of this compendious practice explained page 51 and 52 of theſe Precepts.

XV. The moon's obſerved diſtance from a ſtar or the ſun, with the altitudes of both, and the moon's horizontal parallax being given, to find their correct diſtance cleared of refraction and parallax?

1ſt. To the log-ſine of the moon's horizontal parallax add the log-coſine of the moon's apparent altitude, uſing five decimal places of the logarithms; the ſum, abating 10 from the index, is the log-ſine of the moon's parallax in altitude, from which ſubtract the moon's refraction taken with the moon's apparent altitude out of Table I. (Requiſite Tables) and you will have the correction of the moon's altitude. Add this to the moon's apparent altitude, and you will have the moon's true altitude.——Alſo with the ſtar's apparent altitude take the ſtar's refraction out of Table I. which ſubtract from the ſtar's apparent altitude, and you will have the ſtar's true altitude. But if the moon's diſtance was obſerved from the ſun, with the ſun's apparent altitude take the refraction out of Table I. and his parallax out of Table III.

III. and take the difference, and ſubtract it from the ſun's apparent altitude, and you will have the ſun's true altitude. Take the difference of the true altitudes of the moon and ſtar, or moon and ſun, and the difference of their apparent altitudes.

2dly. Take half the ſum and half the difference of the apparent diſtance and difference of the apparent altitudes.

3dly. To the log-ſines of the above half ſum and half difference add the log-coſines of the true altitudes, and the arithmetical complements of the log-coſines of the apparent altitudes; and take half the ſum.

4thly. From this half ſum take the log-ſine of half the difference of the true altitudes, and look for the remainder among the tangents, and take out the correſponding log-coſine, without taking out the arc, which is unneceſſary.

5thly. Subtract the ſaid log-coſine from the log-ſine of half the difference of the true altitudes increaſed by 10 in the index; the remainder will be the log-ſine of half the true diſtance.

EXAMPLE I.

Suppoſe the apparent altitude of the ſtar to be 24° 48′, that of the moon's centre 12° 30′, and the apparent diſtance of the ſtar from the moon's centre 51° 28′ 35″, and the moon's horizontal parallax 56′ 15″. Required the true diſtance of the ſtar from the moon's centre, cleared of refraction and parallax?
